(Counterexamples to the results of Chapter II.)	

Introductory Abstract

1) Let E be a closed set of complex values w containing $w = 0, \infty$ and at least one other finite value. Let $p(\rho)$ be an increasing positive function defined for $0 \leq \rho < 1$.

We consider in this essay a function $f(z)$ meromorphic in $|z| < 1$ and such that none of the equations

$$f(z) = w,$$

where w lies in E , have more than $p(\rho)$ roots in $|z| \leq \rho$, $0 < \rho < 1$. In other words the valency of $f(z)$ on the set E is at most $p(\rho)$ in $|z| < \rho$, $0 < \rho < 1$. We shall also say sometimes that $f(z)$ takes no value w of E more than $p(\rho)$ times in $|z| \leq \rho$.

Our aim is to find bounds under this hypothesis for the maximum modulus of $f(z)$

$$M[\rho, f(z)] = \max_{0 \leq \theta \leq 2\pi} |f(\rho e^{i\theta})|.$$
