## Introduction

The family $F^{*}$ may be defined over an arbitrary open Riemann surface $Q$. When $Q$ is not simply connected there may exist no single-valued $P H$ [pseudoharmonic] function on $Q$ with $F^{*}$ as its family of level lines. On the universal covering surface $M$ of $Q$ there do exist $P H$ functions $u$, single-valued on $M$ and with a family $F_{M}^{*}$ of level lines which projects into $F^{*}$ on $Q$. While $u$ may not be single-valued on $Q$ it may behave like an integral in that it has branches which differ by a constant, or it may have a real logarithm which has this property. In studying such behavior of $u$ one may focus on the branches of $u$ obtained by continuation of $u$ along a single closed curve $k$ not homotopic to zero on $Q$.

In this way one is led to the essentially typical case of a family $F^{*}$ defined on a sphere $\Sigma^{*}$ with a north pole $N$ and south pole $S$ removed. Although there may be no single-valued PH function $u$ on $\Sigma^{*}$ with $F^{*}$ as its family of level lines there will in general be multiplevalued functions $u$ satisfying linear relations

$$
\begin{equation*}
u\left[p^{(1)}\right]=a u(p)+b \quad(a \neq 0) \tag{1.0}
\end{equation*}
$$

where $p$ and $p^{(1)}$ are points on the universal covering surface $M$ of $\Sigma^{*}$, and where $p$ and $p^{(1)}$ in $M$ project into the same point in $\Sigma^{*}$, but on $M$ have longitudes $\theta$ and $\theta+2 \pi$ respectively. However the values of the constants $a$ and $b$ for which a relation (1.0) may hold depend in a deep way upon the nature of the family $F^{*}$. See MJ 4 and MJ 5.

In the present paper we decompose $\Sigma^{*}$ into canonical regions, "primitives," "caps," "annuli," "polar sectors," "cut sectors," etc., whose nature is determined by $F^{*}$. With $F$ we associate integral indices $\nu(F)$ and $\mu(F)$ [defined in a later paper]. The existence of $P H$ functions $u$ satisfying prescribed linear relations (1.0) depends upon these indices and upon the character of the decomposition of $\Sigma^{*}$.
