

CORRECTION

ESTIMATING A DISTRIBUTION FUNCTION WITH TRUNCATED DATA

BY M. WOODROOFE

The Annals of Statistics (1985) **13** 163–177

The proof of Theorem 5 is incomplete, although the theorem is correct as stated.

On page 175, line 22, it is necessary to show that $\sup_{c < a} |W_n(c)| \rightarrow 0$ in probability as $n \rightarrow \infty$ and then $a \rightarrow 0$. In fact, it suffices to show that $\sup_{c < a} |II_n(c)| \rightarrow 0$, where II_n is defined on page 175. To see this, let

$$M_n(t) = [1 - F_n^*(t)]/[1 - F_*(t)] - 1,$$

for $0 \leq t < b_F$. Then $M_n(t)$ is a martingale in t for each fixed n , $X_n(t) = -\sqrt{n}[1 - F_*(t)]M_n(t)$, for $0 < t < b_F$ and $n \geq 1$, and

$$\begin{aligned} II_n(c) &= \sqrt{n} \int_0^c [M_n(t)/C(t)] dF_*(t) \\ &\quad - \sqrt{n} \int_0^c [1/C(t)][1 - F_*(t)] dM_n(t) \\ &= II_{1,n}(c) - II_{2,n}(c), \end{aligned}$$

say, for all $0 < c < b_F$ and $n > 1$. Now, if a is so small that $F_*(a) < \frac{1}{2}$, then $E|M_n(t)| < 1/\sqrt{n}$ for $0 < t < c$ and (by Fubini)

$$(+) \quad E\left\{\sup_{c < a} |II_{1,n}(c)|\right\} \leq \int_0^a [1/C(t)] dF_*(t),$$

which is independent of n and tends to zero as $a \rightarrow 0$. Next, since $II_{2,n}(c)$ is a martingale in c ,

$$P\left\{\sup_{c < a} |II_{2,n}(c)| \geq \varepsilon\right\} \leq (1/\varepsilon)E[|II_{2,n}(a)|],$$

which approaches 0 as $n \rightarrow \infty$ and $a \rightarrow 0$ for all $\varepsilon > 0$, by (+) and

$$E[II_n(a)^2] \rightarrow 0 \quad (\text{shown in the paper}).$$

I wish to thank Professor Richard Gill for bringing the incompleteness of the proof to my attention.
