A. D. Wallace proposed in his paper<sup>2)</sup> the following problem:

*If a compact mob<sup>3)</sup> has a unique left unit, is this also a right unit?*

In this short note we shall show counter examples to the above-mentioned problem without proof. We will write elsewhere<sup>4)</sup> in these connections and about related topics with detailed discussion. Example 1 is given by N. Kimura and Example 2 by T. Tamura.

**Example 1.** Let  $S$  be a set of all pairs  $(x, y)$  such that  $0 \leq x \leq y \leq 1$ . Consider  $S$  as a topological space with the usual 2-dimensional plane topology, as well as a multiplicative system with multiplication;

$$(x, y)(x', y') = (xx', xy'),$$

where the multiplication in the parentheses at the right hand side will be understood as usual one.

Then  $S$  becomes a compact connected Hausdorff semigroup, and  $(1, 1)$  is a unique left unit. Moreover  $S$  has no right unit.

**Example 2.** Let  $A$  be a compact connected mob with two-sided unit 1 and two-sided zero 0. Such a mob  $A$  really exists, for example, the interval of real numbers from 0 to 1 with the usual topology and multiplication. Let us consider a compact connected Hausdorff space  $B$ . If  $A$  and  $B$  are given, we can construct the union  $S$  of  $A$  and  $B$  such that  $A$  has only one 0 in common with  $B$  by identifying abstractly one element of  $B$  with 0 in  $A$ . The product  $xy$  in  $S$  is defined as the following manner:

$$xy = \begin{cases} x \cdot y & \text{for } x, y \in A, \\ 0 & \text{for } x \in B, y \in A, \\ y & \text{for } x \in S, y \in B, \end{cases}$$

where  $x \cdot y$  is the product of  $x$  and  $y$  in  $A$ . Next we shall introduce a topology into  $S$ . The neighborhood  $N(x)$  of  $x$  is defined as the following manner:

$$\begin{aligned} \text{if } 0 \neq x \in A, \quad N(x) &= U(x) && \text{where } U(x) \text{ is a neighborhood of } \\ & && x \text{ in } A, \\ \text{if } 0 \neq x \in B, \quad N(x) &= V(x) && \text{where } V(x) \text{ is a neighborhood of } \\ & && x \text{ in } B, \end{aligned}$$
