## ON SPHERE-BUNDLES. I

BY I. M. JAMES<sup>1</sup>

Communicated by P. E. Thomas, November 19, 1968

Let  $E$  be an  $(n-1)$ -sphere bundle over a base space  $B$ , with the orthogonal group as structural group. By an *almost-complex structure* on  $E$  we mean a reduction of the structural group to the unitary group. By an  $A$ -structure on  $E$  I mean a fibre-preserving map  $f: E \rightarrow E$  such that  $fx$  is orthogonal to  $x$  for all  $x \in E$ . For example, an almost-complex structure determines such a map through the action<sup>2</sup> of the scalar  $J$  such that  $J^2 = -1$ . Note that  $n$  must be even if an  $A$ -structure exists. When  $E$  is trivial this necessary condition is also sufficient.

I describe  $E$  as *homotopy-symmetric* if  $1 \cong u: E \rightarrow E$ , by a fibre-preserving homotopy, where  $u$  denotes the antipodal map given by  $ux = -x$ . This condition also implies that  $n$  is even. An  $A$ -structure  $f$  on  $E$  determines a fibre-preserving homotopy  $f_t$  ( $t \in I = [0, 1]$ ), where  $f_t x = x \cos \pi t + f(x) \sin \pi t$ , and so  $E$  is homotopy-symmetric. I assert that the converse holds in the stable range,<sup>3</sup> so that we have

**THEOREM 1.** *Let  $B$  be a finite complex such that  $\dim B \leq n-4$ . Then  $E$  admits an  $A$ -structure if and only if  $E$  is homotopy-symmetric.*

A proof can be given as follows. Let  $p: E \rightarrow B$  denote the fibration. Let  $E'$  denote the space of pairs  $(x, y)$ , where  $x, y \in E$ , such that  $px = py$  and such that  $x$  is orthogonal to  $y$ . We fibre  $E'$  over  $E$  with projection  $p'$  given by  $p'(x, y) = x$ . An  $A$ -structure  $f$  on  $E$  determines a cross-section  $f': E \rightarrow E'$ , where  $f'x = (x, fx)$ , and conversely a cross-section determines an  $A$ -structure. Let  $E''$  denote the space of paths  $\lambda$  in  $E$  such that  $p\lambda$  is stationary in  $B$  and such that  $\lambda(0) = \lambda(1)$ . We

<sup>2</sup> We recall that the centre of the structural group acts on the bundle.

<sup>3</sup> The stable range, in relation to this problem, is not quite as extensive as the stable range of ordinary theory.
