### 1. Introduction

A Lie transformation group on a smooth manifold M is a pair (G, M) of a Lie group G which acts smoothly on M. This paper is concerned with the cohomogeneity (abbrev. coh) of (G, M), which is defined by

$$coh(G, M) = dim M - dim G + min \{dim G_x; x \in M\},$$

where  $G_x$  is the isotropy subgroup of G at x. Then

$$\operatorname{coh}(G, M) \ge \dim M - \dim G (=: \operatorname{doh}(G, M)),$$

 $\{x \in M; \text{ coh } (G, M) = \text{doh } (G, M) + \text{dim } G_x\}$  is an open subset of M, and

$$coh (G^o, M) = coh (G, M)$$

where  $G^{o}$  is the identity connected component of G.

An orthogonal transformation group (abbrev. o.t.g.) on an N dimensional Euclidean space  $E^N$  is defined as a pair  $(G, E^N)$  of a connected Lie subgroup G of the full orthogonal group O(N) on  $E^N$ .  $(G, E^N)$  is said to be contained in another o.t.g.  $(G', E^N)$  on  $E^N$  if there is a real linear isometry  $v: E^N \to E^N$  and a Lie group monomorshism  $\tau: G \to G'$  such that

$$\tau(g)i = ig$$
 for all  $g \in G$ .

If moreover  $\tau$  is a Lie group isomorphism,  $(G, \mathbf{E}^N)$  is said to be equivalent to  $(G', \mathbf{E}^N)$ .

Let  $\rho$  be a linear representation on  $\mathbb{R}^N$  over the field  $\mathbb{R}$  of all real numbers of a Lie group G. We say  $(G, \rho, \mathbb{R}^N)$  an orthogonal linear triple and  $\rho$  an orthogonal representation of G if there is a positive definite inner product on  $\mathbb{R}^N$  which is invariant under the action of

Received December 10, 1985.

 $\rho(G)$ . Suppose  $\rho'$  is another orthogonal representation of G. We call  $(G, \rho', \mathbf{R}^N)$  and  $(G, \rho, \mathbf{R}^N)$  are equivalent as real representation if  $\rho'$  and  $\rho$  are equivalent as real representations of G.

An orthogonal linear triple  $(G, \rho, \mathbf{R}^N)$  naturally induces an o.t.g.  $(\rho(G^o), \mathbf{E}^N)$  which is well defined up to equivalences and denoted by  $O(G, \rho, \mathbf{R}^N)$ . We denote

$$coh (G, \rho, \mathbf{R}^N) = coh (O(G, \rho, \mathbf{R}^N)),$$
  

$$doh (G, \rho, \mathbf{R}^N) = doh (O(G, \rho, \mathbf{R}^N)).$$

If G is compact, then any real representation of G is an orthogonal linear representation, and the corresponding o.t.g. is called a *compact linear group*.

An o.t.g. is called *maximal* if it is not properly contained in an o.t.g. of the same cohomogeneity. Suppose  $(G, \mathbf{E}^N)$  is a maximal o.t.g. If it contains a compact linear group  $(K, \mathbf{E}^N)$  of the same cohomogeneity, then itself is a compact linear group. In fact, the closure  $\bar{G}$  of G in O(N) is compact and

$$coh (\bar{G}, \mathbf{E}^N) = coh (G, \mathbf{E}^N)$$

since  $\{x \in E^N; G(x) \text{ is closed (i.e., } \overline{G}(x) = \overline{G(x)} = G(x)), \text{ coh } (G, E^N) = N - \dim G + \dim G_x\}$  contains an open dense subset  $\{x \in E^N; \text{ coh } (K, E^N) = N - \dim K + \dim K_x\}$  of  $E^N$ .

Hsiang-Lawson [11] studied a classification of all compact linear groups of cohomogeneity 2 or 3 and maximal by means of the classification of compact linear groups which has a non trivial isotropy subgroup at a point of a principal orbit (cf. Kramer [15], Hsiang [10] and Hsiang-Hsiang [9]). As a result, most of them can be induced from the linear isotropy representations of Riemannian symmetric pairs.

Conversely, the linear isotropy representation of each Riemannian symmetric pair of rank r induces a compact linear group of cohomogeneity r(cf. Takagi-Takahashi [19]). Any of its orbit in the representation space is an R-space in the meaning of Takeuchi [20] (cf. Takeuchi-Kobayashi [21]). A principal R-space denotes an R-space of the highest dimension among all R-spaces associated with a given Riemannian symmetric pair.

From tables of Takagi-Takahashi [19, Table I and II], it appears that two principal *R*-spaces associated with two distinct Riemannian symmetric rairs of rank 2 are not equivalent as Riemannian manifolds nor Riemannian submanifolds of a hypersphere of the representation space. Especially if two maximal o.t.g.'s of cohomogeneity 2 contain o.t.g.'s from two distinct Riemannian symmetric pairs of rank 2 respectively, then they are not equivalent (cf. Ozeki-Takeuchi [17; Theorem 1, Theorem 2]).

However it is well known that the o.t.g. from the Riemannian symmetric pair  $(G_2, SO(4))$  of rank 2 is missed in a theorem of Hsiang-Lawson [11; Theorem 5] (cf. Takagi-Takahashi [19], Uchida [23]). More than before, Uchida [23] pointed out many examples of real *reducible* (i.e., non irreducible) compact linear groups of cohomogeneity 3 which shows that another theorem of Hsiang-Lawson[11; Theorem 6] should be properly

modified. Uchida [23; Theorem] also gave a classification theorem of real reducible compact linear groups of cohomogeneity 3 and maximal in a correct form by the use of a classification of compact Lie groups which act transitively on spheres (cf. Montgomery-Samelson [16], Borel [3], [4]).

In this paper, we study the classification of real *irreducible* o.t.g.'s of cohomogeneity at most 3 by a direct method (cf. Sato-Kimura [18], Yokota [25]). We have the list of them in Section 4, which shows that the other theorem of Hsiang-Lawson [11; Theorem 7] should be properly modified and also gives a classification of real irreducible compact linear groups of cohomogeneity 3 in a correct form (cf. Theorem 4.8, Remark 4.10).

Our results also give a proof of the fact that a compact linear group of cohomogeneity 2 and maximal is equivalent to an o.t.g. which is induced from the linear isotropy representation of a Riemannian symmetric pair of rank 2. Topologically, Asoh [2] has already completed the classification of compact Lie groups acting on spheres with an orbit of codimension one, which properly modified the result of H.C. Wang [26] (cf. Hsiang-Hsiang [8]). Recently, Dadok [5] classified real irreducible compact linear groups with certain property, so-called 'polar', which is satisfied by each compact linear group of cohomogeneity 2.

#### **Preliminaries**

For each type of compact simple Lie algebra of dimension g and rank k, we shall investigate (cf. Adams [1], Goto-Grosshans [6])

(1) 'Real' complex irreducible representations of degree m such that

$$d_0:=m-g \leq 3$$
,

(2) Complex irreducible representations of degree m such that

$$d_1 = 2m - g \leq 4$$
,

'Quaternion' complex irreducible representations of degree 2m such that

$$d_2 := 4m - g \le 6$$
.

We denote a compact simple Lie algebra of type  $X_k$  by  $X_k$  (X=A, B, C, D, E, F, or G) and the corresponding compact simply connected Lie group also by  $X_k$ . A complex irreducible representation of the highest weight  $\Lambda$  is denoted by  $\Lambda$ . Especially the trivial representation is denoted by 0. The fundamental weights with respect to the simple roots  $\alpha_1$ ,  $\alpha_2, \cdots, \alpha_k$  are denoted by

$$\Lambda_1, \Lambda_2, \cdots, \Lambda_k$$

(A)

The simple roots of  $A_k$  are given by a Dynkin diagram:

$$\alpha_1 - \alpha_2 - \cdots - \alpha_k \quad (k \ge 1).$$

(1) 'Real' complex irreducible representations of  $A_k$  are given by

$$\Lambda = 2\lambda_1 \Lambda_1 \text{ (if } k = 1), \ \Sigma_{i=1}^{h+1} \lambda_i (\Lambda_i + \Lambda_{k-i+1}) \text{ (if } k = 2h+2),$$
$$\lambda_{2h+2} \Lambda_{2h+2} + \sum_{i=1}^{2h+1} \lambda_i (\Lambda_i + \Lambda_{k-i+1}) \text{ (if } k = 4h+3),$$

or

$$2\lambda_{2h+3}\Lambda_{2h+3} + \sum_{i=1}^{2h+2} \lambda_i(\Lambda_i + \Lambda_{k-i+1}) \text{ (if } k = 4h+5),$$

where h and  $\lambda_i(i=1, \dots, \lfloor (k+1)/2 \rfloor)$  are non-negative integers, and [p] denotes the maximal integer at most p.

PROPOSITION 2.1 If  $d_0$ :=deg  $\Lambda - k^2 - 2k \le 3$ , then  $\Lambda$  is equivalent as a complex representation of  $A_k(k \ge 1)$  to one of the followings:

$$d_0 < 0$$
:  $\Lambda_2(k=3)$ ,  $0(k \ge 1)$ ,  
 $d_0 = 0$ :  $2\Lambda_1(k=1)$ ,  $\Lambda_1 + \Lambda_k(k \ge 2)$ ,  
 $d_0 = 2$ :  $4\Lambda_1(k=1)$ .

PROOF: If  $\lambda_i \ge 1$  for some  $i=4, \cdots$ , or [(k+1)/2], then  $k \ge 7$  and  $d_0 \ge \deg \Lambda_4 - k^2 - 2k \ge_{k+1} C_4 - k^2 - 2k \ge 7$ . If  $[(k+1)/2] \ge 3$  and  $\lambda_3 \ge 1$ , then  $k \ge 5$  and  $d_0 \ge \deg (\Lambda_3 + \Lambda_{k-2}) - k^2 - 2k = (k+2)(k+1)^2 k^2 (k-4)/36 - k^2 - 2k \ge 140$ . If  $\lambda_2 \ge 1$  and  $k \ge 4$ , then  $d_0 \ge \deg (\Lambda_2 + \Lambda_{k-1}) - k^2 - 2k = (k+1)^2 (k^2 - 4)/4 - k^2 - 2k \ge 51$ . Therefore  $\Lambda = 0(k \ge 1)$ ,  $2\lambda_1 \Lambda_1(k=1)$ ,  $\lambda_1 (\Lambda_1 + \Lambda_k)(k \ge 2)$ , or  $\lambda_2 \Lambda_2 + \lambda_1 (\Lambda_1 + \Lambda_3)(k=3)$ . If k=1 and  $\lambda_1 \ge 3$ , then  $d_0 \ge \deg 6\Lambda_1 - 3 = 4$ . If  $k \ge 2$  and  $\lambda_1 \ge 2$ , then  $d_0 \ge \deg 2(\Lambda_1 + \Lambda_k) - k^2 - 2k = k(k+1)^2 (k+4)/4 - k^2 - 2k \ge 19$ . If k=3 and  $\lambda_2 \ge 2$ , then  $d_0 \ge \deg 2\Lambda_2 - 15 = 5$ . If k=3 and  $\lambda_1 = \lambda_2 = 1$ , then  $d_0 \ge \deg (\Lambda_1 + \Lambda_2 + \Lambda_3) - 15 = 49$ . Q.E.D.

(2) Complex irreducible representations of  $A_k(k \ge 1)$  are given by  $A = \sum_{i=1}^k \lambda_i A_i$  where  $\lambda_i(i=1, \dots, k)$  are non-negative integers.

PROPOSITION 2.2 If  $d_1$ :=2deg  $\Lambda - k^2 - 2k \le 4$ , then  $\Lambda$  is equivalent as a complex representation of  $A_k(k \ge 1)$  to one of the followings:

$$0(k \ge 1)$$
,  $\Lambda_1(k \ge 1)$ ,  $2\Lambda_1(k = 1, 2)$ ,  $\Lambda_2(k \ge 2)$ ,  $2\Lambda_2(k = 2)$ ,  $\Lambda_{k-1}(k \ge 4)$ ,  $\Lambda_k(k \ge 3)$ .

PROOF: If k=1 and  $\lambda_1 \ge 3$ , then  $\deg \Lambda \ge \deg 3\Lambda_1 = 4$  and  $d_1 \ge 5$ . If k=2 and  $\lambda_1$  (or  $\lambda_2$ )  $\ge 3$ , then  $\deg \Lambda \ge \deg 3\Lambda_1 = 10$  and  $d_1 \ge 12$ . If  $k \ge 2$ ,  $\lambda_1 \ge 1$  and  $\lambda_k \ge 1$ , then  $\deg \Lambda \ge \deg (\Lambda_1 + \Lambda_k) = k(k+2)$  and  $d_1 \ge 8$ . If  $k \ge 3$  and  $\lambda_1$  (or  $\lambda_k$ )  $\ge 2$ , then  $\deg \Lambda \ge \deg 2\Lambda_1 = (k+1)(k+2)$  /2 and  $d_1 \ge 5$ . If  $\lambda_i \ge 1$  for some  $i=3, \dots, k-2$ , then  $\deg \Lambda \ge \deg \Lambda_3 = k(k^2-1)/6$ ,  $k \ge 5$  and  $d_1 \ge 5$ . If  $\lambda_2$  (or  $\lambda_{k-1}$ )  $\ge 2$  and  $2 \le k-1$ , then  $\deg \Lambda \ge \deg 2\Lambda_2 = k(k+1)^2(k+2)/12$ ,  $k \ge 3$  and  $d_1 \ge 25$ . If  $\lambda_2 \ge 1$ ,  $\lambda_{k-1} \ge 1$  and 2 < k-1, then  $\deg \Lambda \ge \deg (\Lambda_2 + \Lambda_{k-1}) = (k+1)^2(k^2-4)/4$ ,

 $k \ge 4$  and  $d_1 \ge 126$ . If  $\lambda_1 \ge 1$ ,  $\lambda_{k-1} \ge 1$  and 1 < k-1, then  $\deg \Lambda \ge \deg (\Lambda_1 + \Lambda_{k-1}) = (k+2)$   $(k^2-1)/2$ ,  $k \ge 3$  and  $d_1 \ge 15$ . If  $\lambda_2 \ge 1$ ,  $\lambda_k \ge 1$  and 2 < k, then  $d_1 \ge 15$ . If  $\lambda_1 \ge 1$ ,  $\lambda_2 \ge 1$  (or  $\lambda_{k-1} \ge 1$ ,  $\lambda_k \ge 1$ ) and 2 < k-1, then  $\deg \Lambda \ge \deg (\Lambda_1 + \Lambda_2) = 2k(k+1)(k+2)/3$ ,  $d_1 \ge 56$ . Q.E.D.

REMARK 2.3  $2\Lambda_1(k=1)$ ,  $\Lambda_2(k=3)$  are 'real'.  $\Lambda_1(k=1)$  is 'quaternion'.  $\Lambda_1$ ,  $\Lambda_k(k \ge 2)$  (resp.  $\Lambda_2$ ,  $\Lambda_{k-1}(k \ge 4)$ , resp.  $2\Lambda_1$ ,  $2\Lambda_2(k=2)$ ) are conjugate from each other.

(3) 'Quaternion' complex irreducible representations of  $A_k(k \ge 1)$  are given as  $\Lambda = (2\lambda_{2h+1} + 1) \Lambda_{2h+1} + \sum_{i=1}^{2h} \lambda_i (\Lambda_i + \Lambda_{k-i+1})$  where k = 4h + 1,  $\lambda_i$  and h are non-negative integers.

PROPOSITION 2.4 If  $d_2$ :=2deg  $\Lambda - k^2 - 2k \le 8$ , then  $\Lambda$  is equivalent as a complex representation of  $A_k(k \ge 1)$  to one of the followings:

$$d_2=1$$
:  $\Lambda_1(k=1)$ ,  
 $d_2=5$ :  $3\Lambda_1(k=1)$ ,  $\Lambda_3(k=5)$ .

PROOF: If  $k=4h+1\geq 6$ , then  $k\geq 9$  and  $d_2\geq 2\deg \Lambda_{2h+1}-k^2-2k\geq 2\deg \Lambda_5-k^2-2k\geq 405$ . So k=1 or 5. Suppose k=1. If  $\lambda_1\geq 2$ , then  $d_2=2\deg (2\lambda_1+1) \Lambda_1-3\geq 2\deg 5\Lambda_1-3=9$ . So  $\Lambda=\Lambda_1$  or  $3\Lambda_1$ . Next suppose k=5. If  $\lambda_2\geq 1$ , then  $d_2\geq 2\deg (\Lambda_2+\Lambda_4)-35=343$ . If  $\lambda_1\geq 1$ , then  $d_2\geq 2\deg (\Lambda_1+\Lambda_5)-35=35$ . If  $\lambda_3\geq 1$ , then  $d_2\geq 2\deg 3\Lambda_3-35=1925$ . So  $\Lambda=\Lambda_3$ . Q.E.D.

(C)

The simple roots of  $C_k$  are given by a Dynkin diagram:

$$\alpha_1 - \alpha_2 - \cdots - \alpha_{k-1} \leftarrow \alpha_k \quad (k \ge 2).$$

(1) 'Real' complex irreducible representations of  $C_k(k \ge 2)$  are given by  $A = \sum_{i=1}^k \lambda_i A_i$  where  $\sum_{i:odd} \lambda_i$  is even and  $\lambda_i(i=1, \dots, k)$  are non-negative integers.

PROPOSITION 2.5 If  $d_0$ :=deg  $\Lambda - k(2k+1) \le 3$ , then  $\Lambda$  is equivalent as a complex representation of  $C_k(k \ge 2)$  to one of the followings:

$$d_0 < 0$$
:  $0(k \ge 2)$ ,  $\Lambda_2(k \ge 2)$ ,  $d_0 = 0$ :  $2\Lambda_1(k \ge 2)$ .

PROOF: Suppose  $k \ge 5$ . Then  $\deg \Lambda_3 < \deg \Lambda_i$  for  $i = 4, \dots, k$  and  $\deg \Lambda_3 - \dim C_k = 4k(k^2 - 3k - 7) \ge 20$ .  $\deg 3\Lambda_1 - \dim C_k = k(2k + 1)(4k - 1)/3 \ge 165$ .  $\deg (\Lambda_1 + \Lambda_2) - \dim C_k = k(8k^2 - 6k - 11)/3 \ge 265$ .  $\deg 2\Lambda_2 - \dim C_k = k^2(4k^2 - 13)/3 \ge 725$ . So  $\Lambda = 0$ ,  $\Lambda_2$  or  $2\Lambda_1$ . Suppose k = 4. Then the assertion holds since  $\deg \Lambda_3 - \dim C_4 = 12$ ,  $\deg \Lambda_4 - \dim C_4 = 6$ ,  $\deg 2\Lambda_2 - \dim C_4 = 272$ ,  $\deg 3\Lambda_1 - \dim C_4 = 84$  and  $\deg (\Lambda_1 + \Lambda_2) - \dim C_4 = 124$ . Suppose

k=3. Then the assertion holds since deg  $3\Lambda_1$ -dim  $C_3=35$ , deg  $(\Lambda_1+\Lambda_2)$ -dim  $C_3=43$ , deg  $(\Lambda_1+\Lambda_3)$ -dim  $C_3=49$ , deg  $2\Lambda_3$ -dim  $C_3=63$  and deg  $2\Lambda_2$ -dim  $C_3=69$ . Suppose k=2. Then the assertion holds since deg  $4\Lambda_1$ -dim  $C_2=25$ , deg  $2\Lambda_2$ -dim  $C_2=4$  and deg  $(2\Lambda_1+\Lambda_2)$ -dim  $C_2=25$ . Q.E.D.

(2) Complex irreducible representations of  $C_k(k \ge 2)$  are given by  $\Lambda = \sum_{i=1}^k \lambda_i \Lambda_i$  where  $\lambda_i(i=1, \dots, k)$  are non-negative integers.

PROPOSITION 2.6 If  $d_1$ :=2deg  $\Lambda - k(2k+1) \le 6$ , then  $\Lambda$  is equivalent as a complex representation of  $C_k(k \ge 2)$  to one of the followings:

$$0(k \ge 2)$$
,  $\Lambda_1(k \ge 2)$ ,  $\Lambda_2(k = 2)$ .

PROOF: Suppose  $k \ge 3$ . If  $\Lambda$  is not equivalent to 0 nor  $\Lambda_1$ , then  $\deg \Lambda \ge \deg \Lambda_2$ , so  $d_1 \ge 2\deg \Lambda_2 - \dim C_k = 2k^2 - 3k - 2 \ge 7$ . Suppose k = 2. The the assertion holds since  $2\deg 2\Lambda_1 - \dim C_2 = 10$ ,  $2\deg (\Lambda_1 + \Lambda_2) - \dim C_2 = 22$  and  $2\deg 2\Lambda_2 - \dim C_2 = 18$ . Q.E.D.

(3) 'Quaternion' complex irreducible representations of  $C_k(k \ge 2)$  are given by  $A = \sum_{i=1}^k \lambda_i A_i$  where  $\sum_{i:odd} \lambda_i$  is odd and  $\lambda_i(i=1, \dots, k)$  are non-negative integers.

PROPOSITION 2.7 If  $d_2$ :=2deg  $\Lambda - k(2k+1) \le 6$ , then  $\Lambda$  is equivalent as a complex representation of  $C_k(k \ge 2)$  to one of the followings:

$$\Lambda_1(k \geq 2)$$
.

PROOF: Suppose  $k \ge 3$ . If  $\Lambda$  is not equivalent to  $\Lambda_1$ , then deg  $\Lambda \ge \deg \Lambda_2$ , so  $d_2 \ge 2\deg \Lambda_2 - \dim C_k = 2k^2 - 3k - 2 \ge 7$ . Suppose k = 2. If  $\Lambda$  is not equivalent to  $\Lambda_1$ , then deg  $\Lambda \ge \deg (\Lambda_1 + \Lambda_2) = 16$ , so  $d_2 \ge 22$ . Q.E.D.

(B)

The simple roots of  $B_k$  are given by a Dynkin diagram:

$$\alpha_1 - \alpha_2 - \cdots - \alpha_{k-1} \Longrightarrow \alpha_k \quad (k \ge 3).$$

(1) 'Real' complex irreducible representations of  $B_k(k \ge 3)$  are given by  $\Lambda = \sum_{i=1}^k \lambda_i \Lambda_i$  (if k = 4h + 3 or 4h + 4),  $2\lambda_k \Lambda_k + \sum_{i=1}^{k-1} \lambda_i \Lambda_i$  (otherwise) where h and  $\lambda_i(i=1, \dots, k)$  are non-negative integers.

PROPOSITION 2.8 If  $d_0:=\deg \Lambda - k(2k+1) \le 5$ , then  $\Lambda$  is equivalent as a complex representation of  $B_k(k \ge 3)$  to one of the followings:

$$d_0 < 0$$
:  $\Lambda_1(k \ge 3)$ ,  $\Lambda_k(k = 3 \text{ or } 4)$ ,  $0(k \ge 3)$ ,  $d_0 = 0$ :  $\Lambda_2(k \ge 3)$ .

PROOF: If  $\lambda_i \ge 1$  for some  $i=3, \dots, k-1$ , then  $k \ge 4$  and  $d_0 \ge \deg \Lambda_3 - \dim B_k = k(2k+1)(2k-4)/3 \ge 48$ . If  $\lambda_1 \ge 2$ , then  $d_0 \ge \deg 2\Lambda_1 - \dim B_k = 2k \ge 6$ . If  $\lambda_2 \ge 2$ , then  $d_0 \ge \deg 2\Lambda_2 - \dim B_k = (2k+3)(2k+1)(k+1)(k-1)/3 - k(2k+1) \ge 147$ . If  $\lambda_1 \ge 1$  and  $\lambda_2 \ge 1$ , then  $d_0 \ge \deg (\Lambda_1 + \Lambda_2) - \dim B_k = (2k+1)(k+1)(4k-3) \ge 84$ . Then  $\Lambda = \Lambda_1$ ,  $\Lambda_2$ ,  $\Lambda_k$ , or

 $\Lambda_2 + \Lambda_k$  (if k = 4h + 3 or 4h + 4),  $\Lambda_1$  or  $\Lambda_2$  (otherwise) since  $\deg 2\Lambda_k - \dim B_k =_{2k+1} C_{k+1} - k(2k+1) \ge 14$  and  $\deg (\Lambda_1 + \Lambda_k) - \dim B_k = k2^{k+1} - k(2k+1) \ge 27$ . If k = 4h + 3 or 4h + 4,  $k \ge 5$  and  $\lambda_k \ge 1$ , then  $k \ge 8$  and  $d_0 \ge \deg \Lambda_k - \dim B_k = 2^k - k(2k+1) \ge 120$ . If k = 3 (resp. 4), then  $\deg (\Lambda_2 + \Lambda_k) - \dim B_k = 91$  (resp. 396). Q.E.D.

(2) Complex irreducible representations of  $B_k(k \ge 3)$  are given by  $A = \sum_{i=1}^k \lambda_i A_i$  where  $\lambda_i(i=1, \dots, k)$  are non-negative integers.

PROPOSITION 2.9 If  $d_1$ :=2deg  $\Lambda - k(2k+1) \le 8$ , then  $\Lambda$  is equivalent as a complex representation of  $B_k(k \ge 3)$  to one of the followings:

$$d_1 < 0$$
:  $\Lambda_1(k \ge 3)$ ,  $\Lambda_k(k = 3 \text{ or } 4)$ ,  $0(k \ge 3)$ .

PROOF: If  $\lambda_i \ge 1$  for some  $i = 2, \dots, k-1$ , then  $d_1 \ge 2 \deg \Lambda_2 - k(2k+1) = k(2k+1)$   $\ge 21$ . If  $\lambda_1 \ge 2$ , then  $d_1 \ge 2 \deg 2\Lambda_1 - k(2k+1) = k(2k+5) \ge 33$ . If  $\lambda_k \ge 2$ , then  $d_1 \ge 2 \deg 2\Lambda_k - k(2k+1) = 2_{2k+1}C_{k+1} - k(2k+1) \ge 49$ . If  $\lambda_1 \ge 1$  and  $\lambda_k \ge 1$ , then  $d_1 \ge 2 \deg (\Lambda_1 + \Lambda_k) - k(2k+1) = k2^{k+2} - k(2k+1) \ge 75$ . If  $k \ge 5$ , then  $2 \deg \Lambda_k - k(2k+1) = 2^{k+1} - k(2k+1) \ge 9$ . Q.E.D.

(3) 'Quaternion' complex irreducible representations of  $B_k(k \ge 3)$  are given by  $A = \sum_{i=1}^{k-1} \lambda_i A_i + (2\lambda_k + 1) A_k$  where k = 4h + 5 or 4h + 6, h and  $\lambda_i(i = 1, \dots, k)$  are nonnegative integers. Then  $k \ge 5$ .

PROPOSITION 2.10 There is no 'quaternion' complex irreducible representation of  $B_k$  such that  $d_2$ :=2deg  $A - k(2k+1) \le 8$ .

PROOF: Since  $k \ge 5$ ,  $d_2 \ge 2 \deg A_k - k(2k+1) = 2^{k+1} - k(2k+1) \ge 9$ . Q.E.D.

(D)

The simple roots of  $D_k$  are given by a Dynkin diagram:

$$\alpha_1 - \alpha_2 - \cdots - \alpha_{k-2} - \alpha_{k-1} \quad (k \ge 4).$$

$$\alpha_k$$

(1) 'Real' complex irreducible representations of  $D_k(k \ge 4)$  are given by  $\Lambda = \sum_{i=1}^{k-2} \lambda_i \Lambda_i + \lambda_{k-1} (\Lambda_{k-1} + \Lambda_k)$  (if k = 2h + 5),  $\sum_{i=1}^k \lambda_i \Lambda_i$  (if k = 4h + 4), or  $\sum_{i=1}^{k-2} \lambda_i \Lambda_i + \lambda_{k-1}^* \Lambda_{k-1} + \lambda_k^* \Lambda_k$  (if k = 4h + 6), where  $\lambda_{k-1}^* + \lambda_k^*$  is even, h and  $\lambda_i^{(*)}(i = 1, \dots, k)$  are nonnegative integers.

PROPOSITION 2.11 If  $d_0:=\deg \Lambda - k(2k-1) \le 6$ , then  $\Lambda$  is equivalent as a complex representation of  $D_k(k \ge 4)$  to one of the followings:

$$d_0 < 0$$
:  $0(k \ge 4)$ ,  $\Lambda_1(k \ge 4)$ ,  $\Lambda_4(k = 4)$ ,  $\Lambda_3(k = 4)$   
 $d_0 = 0$ :  $\Lambda_2(k \ge 4)$ .

PROOF: If  $\lambda_i \ge 1$  for some  $i=3, \dots$ , or k-2, then  $k \ge 5$  and  $d_0 \ge \deg \Lambda_3 - k(2k-1) = k(2k-1)(2k-5)/3 \ge 75$ . So  $\lambda_i = 0$  for  $i=3, \dots, k-2$ . Since  $\deg 2\Lambda_1 - k(2k-1) = 2k-1 \ge 7$ ,  $\deg 2\Lambda_2 - k(2k-1) = k^2(4k^2-13) \ge 272$  and  $\deg (\Lambda_1 + \Lambda_2) - k(2k-1) = k(4k-5)(2k+1)/3 \ge 132$ , we have  $\lambda_1 + \lambda_2 \le 1$ . Suppose  $\lambda_{k-1}^{(*)}$  or  $\lambda_k^{(*)} \ge 1$ . If  $k \ge 8$ , then  $d_0 \ge 2^{k-1} - k(2k-1) \ge 8$ . If k=7, then  $d_0 \ge \deg (\Lambda_6 + \Lambda_7) - 91 = 2912$ . If k=6, then  $d_0 \ge \deg (\Lambda_5 + \Lambda_6) - 66 = 726$  or  $d_0 \ge \deg (2\Lambda_5) - 66 = \deg (2\Lambda_6) - 66 = 11C_6 - 66 = 396$ . If k=5, then  $d_0 \ge \deg (\Lambda_4 + \Lambda_5) - 45 = 165$ . If k=4 and  $\lambda_1 \ge 1$ , then  $d_0 \ge \deg (\Lambda_1 + \Lambda_4) - 28 = \deg (\Lambda_1 + \Lambda_3) - 28 = 28$ . If k=4 and  $\lambda_2 \ge 1$ , then  $d_0 \ge \deg (\Lambda_2 + \Lambda_4) - 28 = \deg (\Lambda_2 + \Lambda_3) - 28 = 132$ . So k=4 and  $\Lambda = \Lambda_4$  or  $\Lambda_3$ . Q.E.D.

(2) Complex irreducible representations of  $D_k(k \ge 4)$  are given by  $\Lambda = \sum_{i=1}^k \lambda_i \Lambda_i$  where  $\lambda_i(i=1, \dots, k)$  are non-negative integers.

PROPOSITION 2.12 If  $d_1$ :=2deg  $\Lambda - k(2k-1) \le 36$ , then  $\Lambda$  is equivalent as a complex representation of  $D_k(k \ge 4)$  to one of the followings:

$$d_1 < 0$$
:  $0(k \ge 4)$ ,  $\Lambda_1(k \ge 4)$ ,  $\Lambda_3(k=4)$ ,  $\Lambda_4(k=4)$ ,  $\Lambda_4(k=5)$ ,  $\Lambda_5(k=5)$ ,  $\Lambda_5(k=6)$ .  $\Lambda_6(k=6)$ .

PROOF: If  $\lambda_i \ge 1$  for some  $i = 2, \dots, k-2$ , then  $d_1 \ge 2\deg \Lambda_2 - k(2k-1) = k(2k-1)$   $\ge 28$ . So that  $\lambda_i = 0$  for  $i = 2, \dots, k-2$ . Since  $2\deg 2\Lambda_1 - k(2k-1) = (k+2)(2k-1) \ge 42$ , we have  $\lambda_1 \le 1$ . Suppose  $\lambda_{k-1} + \lambda_k \ge 1$ . Then  $k \le 6$  since  $d_1 \ge 2\deg \Lambda_k - k(2k-1) = 2\deg \Lambda_{k-1} - k(2k-1) = 2^k - k(2k-1) \ge 37$  if  $k \ge 7$ . We have that  $\lambda_1 + \lambda_{k-1} + \lambda_k \le 1$  since  $2\deg (\Lambda_1 + \Lambda_k) - k(2k-1) = 2\deg (\Lambda_1 + \Lambda_{k-1}) - k(2k-1) = (2^k - k)(2k-1) \ge 84$ ,  $2\deg (\Lambda_{k-1} + \Lambda_k) - k(2k-1) = k(2k-1)[4(2k-2)!/\{(k-1)!(k+1)!\} - 1] \ge 84$  and  $2\deg 2\Lambda_k - k(2k-1) = 2\deg 2\Lambda_{k-1} - k(2k-1) = k(2k-1)\{2(2k-2)!/(k!)^2 - 1\} \ge 42$ . Q.E.D.

REMARK 2.13  $\Lambda_4(k=5)$  and  $\Lambda_5(k=5)$  are conjugate.  $\Lambda_3(k=4)$  and  $\Lambda_4(k=4)$  are 'real', and there are outer automorphisms  $\tau_i(i=1,2)$  of  $D_4$  such that  $\Lambda_{30} \circ \tau_1$  and  $\Lambda_{40} \circ \tau_2$  are equivalent as complex representations of  $D_4$  to  $\Lambda_1$ . There is also an outer automorphism  $\tau_3(\text{resp. }\tau_4)$  of  $D_6(\text{resp. }D_5)$  such that  $\Lambda_{50} \circ \tau_3(\text{resp. }\Lambda_{40} \circ \tau_4)$  and  $\Lambda_6(\text{resp. }\Lambda_5)$  are equivalent as complex representations of  $D_6(\text{resp. }D_5)$ .

(3) 'Quaternion' complex irreducible representations of  $D_k(k \ge 4)$  are given by  $\Lambda = \sum_{i=1}^k \lambda_i \Lambda_i$  where  $\lambda_{k-1} + \lambda_k$  is odd, k = 4h + 6, and h,  $\lambda_i (i = 1, \dots, k)$  are non-negative integers.

PROPOSITION 2.14 If  $d_2$ :=2deg  $\Lambda - k(2k-1) \le 36$ , then  $\Lambda$  is equivalent as a complex representation of  $D_k(k \ge 4)$  to one of the followings:

$$d_2 = -2$$
:  $\Lambda_5(k=6)$ ,  $\Lambda_6(k=6)$ .

PROOF: The assertion follows from Proposition 2.12 and Remark 2.13. Q.E.D.

(E)

The simple roots of exceptional Lie algebras are given by Dynkin diagrams:

$$G_{2}: \quad \alpha_{1} \Longrightarrow \alpha_{2}$$

$$F_{4}: \quad \alpha_{1} \longrightarrow \alpha_{2} \Longrightarrow \alpha_{3} \longrightarrow \alpha_{4}$$

$$E_{6}: \quad \alpha_{1} \longrightarrow \alpha_{2} \longrightarrow \alpha_{3} \longrightarrow \alpha_{4} \longrightarrow \alpha_{5}$$

$$\vdots$$

$$E_{7}: \quad \alpha_{1} \longrightarrow \alpha_{2} \longrightarrow \alpha_{3} \longrightarrow \alpha_{4} \longrightarrow \alpha_{5} \longrightarrow \alpha_{6}$$

$$\vdots$$

$$E_{8}: \quad \alpha_{1} \longrightarrow \alpha_{2} \longrightarrow \alpha_{3} \longrightarrow \alpha_{4} \longrightarrow \alpha_{5} \longrightarrow \alpha_{6} \longrightarrow \alpha_{7}$$

$$\vdots$$

$$\alpha_{8}: \quad \alpha_{1} \longrightarrow \alpha_{2} \longrightarrow \alpha_{3} \longrightarrow \alpha_{4} \longrightarrow \alpha_{5} \longrightarrow \alpha_{6} \longrightarrow \alpha_{7}$$

PROPOSITION 2.15 Suppose  $\Lambda$  is a complex irreducible representation of an exceptional Lie algebra of dimension g. If  $d_0$ := deg  $\Lambda - g \le 12$ , then  $\Lambda$  is equivalent as a complex representation to one of the followings:

$$d_0 < 0$$
:  $\Lambda_2(G_2)$ ,  $\Lambda_4(F_4)$ ,  $\Lambda_1(E_6)$ ,  $\Lambda_5(E_6)$ ,  $\Lambda_6(E_7)$ ,  $d_0 = 0$ :  $\Lambda_1(G_2)$ ,  $\Lambda_1(F_4)$ ,  $\Lambda_6(E_6)$ ,  $\Lambda_1(E_7)$ ,  $\Lambda_7(E_8)$ .

PROOF: Case  $G_2$ ) If  $\Lambda$  is not equivalent to  $\Lambda_1$  nor  $\Lambda_2$ , then  $d_0 \ge 13$  since  $\deg 2\Lambda_1 = 77$ ,  $\deg 2\Lambda_2 = 27$  and  $\deg (\Lambda_1 + \Lambda_2) = 64$ . Case  $F_4$ ) If  $\Lambda$  is not equivalent to  $\Lambda_1$  nor  $\Lambda_2$ , then  $d_0 \ge 221$  since  $\deg 2\Lambda_1 = \deg (\Lambda_1 + \Lambda_4) = 1053$ ,  $\deg 2\Lambda_4 = 324$ ,  $\deg \Lambda_2 = 1274$  and  $\deg \Lambda_3 = 273$ . Case  $E_6$ ) If  $\Lambda$  is not equivalent to  $\Lambda_1$ ,  $\Lambda_5$ , nor  $\Lambda_6$ , then  $d_0 \ge 273$  since  $\deg 2\Lambda_1 = \deg 2\Lambda_5 = \deg \Lambda_2 = \deg \Lambda_4 = 351$ ,  $\deg \Lambda_3 = 2925$ ,  $\deg 2\Lambda_6 = 2430$ ,  $\deg (\Lambda_1 + \Lambda_5) = 650$  and  $\deg (\Lambda_1 + \Lambda_6) = \deg (\Lambda_5 + \Lambda_6) = 1728$ . Case  $E_7$ ) In  $\Lambda$  is not equivalent to  $\Lambda_1$  nor  $\Lambda_6$ , then  $d_0 \ge 779$  since  $\deg \Lambda_2 = 8645$ ,  $\deg \Lambda_3 = 365750$ ,  $\deg \Lambda_4 = 27664$ ,  $\deg \Lambda_5 = 1539$ ,  $\deg \Lambda_7 = 912$ ,  $\deg 2\Lambda_1 = 7371$ ,  $\deg 2\Lambda_6 = 1463$  and  $\deg (\Lambda_1 + \Lambda_6) = 3920$ . Case  $E_8$ ) If  $\Lambda$  is not equivalent to  $\Lambda_7$ , then  $d_0 \ge 3627$  since  $\deg \Lambda_1 = 3825$ ,  $\deg \Lambda_2 = 6696000$ ,  $\deg \Lambda_3 = 6899079264$ ,  $\deg \Lambda_4 = 146325270$ ,  $\deg \Lambda_5 = 2450240$ ,  $\deg \Lambda_6 = 30380$ ,  $\deg \Lambda_8 = 147250$ , and  $\deg 2\Lambda_7 = 27000$ . Q.E.D.

REMARK 2.16  $\Lambda_2(G_2)$  is 'real' of degree 7.  $\Lambda_4(F_4)$  is 'real' of degree 26.  $\Lambda_1(E_6)$  and  $\Lambda_5(E_6)$  are conjugate from each other and of degree 27.  $\Lambda_6(E_7)$  is 'quaternion' of degree 56.  $\Lambda_1(G_2)$ ,  $\Lambda_1(F_4)$ ,  $\Lambda_6(E_6)$ ,  $\Lambda_1(E_7)$  and  $\Lambda_7(E_8)$  are the adjoint representations, especially 'real', of degree 14, 52, 78, 144, 248 respectively. Any  $\Lambda$  of  $d_1$  or  $d_2 \le 12$  is contained in the above list since  $d_1 = d_2 > d_0$ .

Next propositions are also useful in sections 3 and 4.

PROPOSITION 2.17 Each non trivial 'real' complex irreducible representation of degree at most 3 of a compact simple Lie algebra is equivalent as a complex representation to one of the followings:

degree 3:  $2\Lambda_1(A_1)$ .

PROOF: The assertion follows from Prop. 2.1, 2,5, 2.8, 2.11 and 2.15 since  $d_0$  is less than the degree which is at most 3. Q.E.D.

PROPOSITION 2.18 Each non trivial complex irreducible representation of degree at most 3 of a compact simple Lie algebra is equivalent as a complex representation to one of the followings:

degree 2:  $\Lambda_1(A_1)$ , degree 3:  $2\Lambda_1(A_1)$ ,  $\Lambda_1(A_2)$ ,  $\Lambda_2(A_2)$ .

PROOF: The assertion follows from Prop.'s 2.2, 2.6, 2.9, 2.12 and 2.15 since  $d_1 = 2 \text{ degree} - g \le 2.3 - 3 = 3$ . Q.E.D.

REMARK 2.19  $\Lambda_2(A_2)$  is conjugate to  $\Lambda_1(A_2)$ .

PROPOSITION 2.20 Each non trivial 'quaternion' complex irreducible representation of degree at most 6 of a compact simple Lie algebra is equivalent as a complex representation to one of the followings:

degree 2:  $\Lambda_1(A_1)$ , degree 4:  $3\Lambda_1(A_1)$ ,  $\Lambda_1(C_2)$ , degree 6:  $5\Lambda_1(A_1)$ ,  $\Lambda_1(C_3)$ .

PROOF: The assertion is trivial in the case of  $A_1$ . Otherwise, it follows from Prop.'s 2.4, 2.7, 2.10, 2.14 and 2.15 since  $d_2=2$  degree  $-g \le 2 \cdot 6 - 8 = 4$ . Q.E.D.

### 3. Basic Classification by cohomogeneity

Let (G, M) be a Lie transformation group. For  $x \in M$ , we denote G(x) the orbit of G through x, and  $G_x$  the isotropy subgroup of G at x.

LEMMA 3.1 Let (G, M), (G, N) be Lie transformation groups and f be a G-equivariant submersion from M onto N with the property:

$$f^{-1}(f(x)) = G_{f(x)}x$$

at a fixed  $x \in M$ . Then we have that

 $\dim M$ - $\dim G$ + $\dim G_x$ = $\dim N$ - $\dim G$ + $\dim G_{f(x)}$ .

PROOF: dim M=dim N+dim  $f^{-1}(f(x))$ =dim N+dim  $G_{f(x)}(x)$ =dim N+dim  $G_{f(x)}$ -dim  $G_x$  since  $(G_{f(x)})_x = G_x$ . Q.E.D.

Let R, C and H be the set of real numbers, complex numbers and quaternions respec-

tively. Naturally H contains C, and C contains R. The conjugate u+jv of  $u+jv \in H(u, v \in C)$  is defined by

$$\overline{u+jv} = \bar{u}-jv$$

where  $\bar{u}$  is the complex conjugate of u. For u+jv,  $u'+jv' \in H$ , the *product* of them is defined by

$$(u+jv)(u'+jv') = (uu'-\bar{v}v') + j(vu'+\bar{u}v').$$

Let F be R, C, or H. The set of all  $(n_1, n_2)$  -matrixes with coefficients F is denoted by  $F(n_1, n_2)$ . For  $X \in F(n_1, n_2)$ , we denote the *conjugate* of X with respect to the coefficients by  $\bar{X}$ , and the *transposed* matrix of X by  ${}^tX$ . We write  $F^n = F(n, 1)$ , F(n) = F(n, n), and denote the identity matrix of F(n) by  $I_n$ . We denote  $hF(n) = \{X \in F(n); {}^t\bar{X} = X\}$ ,  $pF(n) = \{X \in hF(n); X \text{ is positive definite}\}$ , and use the following notations for classical groups:

$$GF(n) = \{X \in F(n); {}^t\bar{X}X = X{}^t\bar{X} = I_n\}.$$

If  $F = \mathbf{R}$  or  $\mathbf{C}$ , denote

$$SF(n) = \{X \in GF(n); \det X = 1\}.$$

Then GR(n) = O(n), GC(n) = U(n), GH(n) = Sp(n), SR(n) = SO(n) and SC(n) = SU(n) in usual notations. Any subgroup of GF(n) acts on  $F^n$  linearly over right multiplications of F by usual manner and acts on F(n) (resp. F(n)) by

$$A \cdot X = AX^t \bar{A} \tag{3.1}$$

for  $A \in GF(n)$ ,  $X \in hF(n)$  (resp. pF(n)). Each matrix of hF(n) can be transformed to a diagonal form by the action of GF(n) (resp. SF(n)). Similarly any subgroup of  $GF(n_1) \times GF(n_2)$  acts on  $F(n_1, n_2)$  by

$$(A, B) \cdot X = AX^t \bar{B} \tag{3.2}$$

for  $(A, B) \in GF(n_1) \times GF(n_2), X \in F(n_1, n_2).$ 

We use mappings  $k, k' : H(n_1, n_2) \longrightarrow C(2n_1, 2n_2)$ ,

 $h: H(n_1, n_2) \longrightarrow C(2n_1, n_2)$  and  $h': H(n_1, n_2) \longrightarrow C(n_1, 2n_2)$  such that

$$k(U+jV) = \begin{pmatrix} U & -\bar{V} \\ V & \bar{U} \end{pmatrix}, \quad k'(U+Vj) = \begin{pmatrix} U & V \\ -\bar{V} & \bar{U} \end{pmatrix}, \quad h(U+jV) = \begin{pmatrix} U \\ V \end{pmatrix},$$

$$h'(U+V_j)=(U, V)$$
 for  $U, V \in C(n_1, n_2)$ .

Then k, k' are real linear injections such that

$${}^{t}\overline{k(P)} = k({}^{t}\overline{P}), \quad {}^{t}\overline{k'(P)} = k'({}^{t}\overline{P}), \quad k(PQ) = k(P)k(Q), \quad k'(PQ) = k'(P)k'(Q)$$
for  $P \in H(n_1, n_2), \ Q \in H(n_2, n_3),$ 

and h(resp. h') is a linear bijection over right (resp. left) multiplications of C such that

h(PQ) = k(P)h(Q)(resp. h'(PQ) = h'(P)k(Q)).

For  $P \in H(n_1, n_2)$ , we see that column-rank<sub>H</sub> $(P) := n_2 - \dim_H \{Q \in H^{n_2}; PQ = 0\} = (2n_2 - \dim_C \{Q \in H^{n_2}; PQ = 0\})/2 = (\operatorname{rank}_C k(P))/2 = (\operatorname{rank}_C k'(P))/2 = (2n_1 - \dim_C \{Q \in H(1, n_1); QP = 0\})/2 = n_1 - \dim_H \{Q \in H(1, n_1); QP = 0\} = : \text{row-rank}_H(P)$ . Note that the linear independence in  $H^{n_2}$ ,  $H(1, n_1)$  over right multiplications of H is equivalent to one over left multiplications of H respectively owing to  $\overline{pq} = \overline{q} \cdot \overline{p}$  (p, q in H). Therefore  $\operatorname{rank}_H(P) := \operatorname{column-rank}_H(P) = \operatorname{row-rank}_H(P)$  is well-defined. Denote  $MF(n_1, n_2) = \{X \in F(n_1, n_2); \operatorname{rank}_F(X) = \max(n_1, n_2)\}$ . Then  $k(MH(n_1, n_2)) = MC(2n_1, 2n_2) \cap k(H(n_1, n_2))$ .

Assume  $n_1 \ge n_2$ . Denote  $f: MF(n_1, n_2) \longrightarrow pF(n_2)$ 

such that  $f(X) = {}^{t}\overline{X}X$  for  $X \in MF(n_1, n_2)$ . Then f is  $GF(n_1) \times GF(n_2)$ -equivariant with respect to the action (3.2) on  $MF(n_1, n_2)$  and the following action on  $pF(n_2)$ :

$$(A, B) \cdot Y = BY^t \bar{B} \tag{3.3}$$

for  $(A, B) \in GF(n_1) \times GF(n_2)$ ,  $Y \in pF(n_2)$ .

LEMMA 3.2 (1) f is a submersion.

- (2)  $f^{-1}(f(X)) = (GF(n_1) \times \{I_{n_2}\}) \cdot X \text{ for } X \in MF(n_1, n_2).$
- (3) If  $n_1 > n_2$ , then  $f^{-1}(f(X)) = (SF(n_1) \times \{I_{n_2}\}) \cdot X$  for  $X \in MF(n_1, n_2)$  where  $F = \mathbb{R}$  or  $\mathbb{C}$ .

PROOF: (1) Since any diagonal matrix in  $pF(n_2)$  is in the image of f, it follows that f is onto from the diagonalizability by the action (3.3). To prove  $df_{X_0}: F(n_1, n_2) \to hF(n_2)$ ;  $X \to {}^t \bar{X} X_0 + {}^t \bar{X}_0 X$  is onto at  $X_0 \in MF(n_1, n_2)$ , if we use the action (3.2) of  $GF(n_1) \times GF(n_2)$ , we may assume that  $X_0$  has the following form for some non-zero  $x_i \in R$   $(i=1, \dots, n_2)$ :

$$X_0 = \begin{bmatrix} x_1 & & \\ & \ddots & \\ & & x_{n_2} \end{bmatrix}$$
. In fact, the action (3.3) of  $\{I_{n_1}\} \times GF(n_2)$  transforms  ${}^t\bar{X}_0X_0$  to a diagonal

form and the action (3.2) of  $GF(n_1) \times \{I_{n_2}\}$  gives a required form. Then it is easy to show that  $df_{X_0}$  is onto. (2) Suppose f(X) = f(Y). Denote  $X = [x_1, \dots, x_{n_2}]$ ,  $Y = [y_1, \dots, y_{n_2}]$  where  $x_i, y_i \in F^{n_1}$ , then  ${}^t\bar{x}_ix_j = {}^t\bar{y}_iy_j$   $(i, j = 1, \dots, n_2)$ . We can choose  $x_h, y_k$   $(h, k = n_2 + 1, \dots, n_1)$  such that  ${}^t\bar{x}_ix_h = {}^t\bar{y}_iy_h = 0$  and  ${}^t\bar{x}_hx_k = {}^t\bar{y}_hy_k = \delta_{hk}$ . Then  $X' = [x_1, \dots, x_{n_1}]$ ,  $Y' = [y_1, \dots, y_{n_1}]$  have the inverse matrices. For  $A = Y'X'^{-1}$ , A is in  $GF(n_1)$  since  ${}^t\bar{X}'X' = {}^t\bar{Y}'Y'$ . We have  $(A, I_{n_2}) \cdot X = Y$ . (3) If F = R or C, then  $X'' = X' \cdot \text{diag}[1, \dots, 1, \det X'^{-1}]$  and  $Y'' = Y' \cdot \text{diag}[1, \dots, 1, \det Y'^{-1}]$  are in  $SL(n_1, F)$ . Then  $B = Y''X''^{-1}$  is in  $SF(n_1)$  and  $(B, I_{n_2}) \cdot X = Y$  if  $n_1 > n_2$ . Q.E.D.

The tensor product  $F^{n_1} \underset{F}{\otimes} \cdots \underset{F}{\otimes} F^{n_s}$  over F of  $F^{n_1}, \cdots, F^{n_s}$  is defined if  $F = \mathbb{R}$  or C. Naturally  $\mathbb{R}^{n_1} \underset{R}{\otimes} \cdots \underset{R}{\otimes} \mathbb{R}^{n_s} = \{z \text{ in } C^{n_1} \underset{C}{\otimes} \cdots \underset{C}{\otimes} C^{n_s}; \bar{z} = z\}$  where denotes the complex conjugation extended naturally on  $C^{n_1} \underset{C}{\otimes} \cdots \underset{C}{\otimes} C^{n_s}$ . If F = H, then we consider the real linear map  $\tilde{J}$ :  $C^{2n_1} \underset{C}{\otimes} \cdots \underset{C}{\otimes} C^{2n_s} \to C^{2n_1} \underset{C}{\otimes} \cdots \underset{C}{\otimes} C^{2n_s}; \; \Sigma_i \; z_i (h(P_{i1}) \otimes \cdots \otimes h(P_{is})) \to \Sigma_i \; \bar{z}_i (h(P_{i1}j) \otimes \cdots \otimes h(P_{is}j)),$  where  $z_i \in C$  and  $P_{it} \in H^{n_t}(t = 1, \cdots, s)$ . Then  $\tilde{J}^2 = id$  (if s is even), or -id (if s is odd). The ten-

sor product  $H^{n_1} \underset{H}{\otimes} \cdots \underset{H}{\otimes} H^{n_s}$  over right H of  $H^{n_1}, \cdots, H^{n_s}$  is defined by  $H^{n_1} \underset{H}{\otimes} \cdots \underset{H}{\otimes} H^{n_s} := \{Z \in C^{2n_1} \underset{C}{\otimes} \cdots \underset{C}{\otimes} C^{2n_s}; \tilde{J}Z = Z\}$  (if s is even), or  $C^{2n_1} \underset{C}{\otimes} \cdots \underset{C}{\otimes} C^{2n_s}$  with the quaternion structure  $\tilde{J}$  (if s is odd). If s = 1, then  $\tilde{J}$  is the standard quaternion structure on  $C^{2n_1} = h(H^{n_1})$ . If s = 2, then  $H^{n_1} \underset{H}{\otimes} H^{n_2}$  is a real form of  $C^{2n_1} \underset{C}{\otimes} C^{2n_2}$  with respect to the real structure  $\tilde{J}$  on  $C^{2n_1} \underset{C}{\otimes} C^{2n_2}$ . For an even s,  $H^{n_1} \underset{H}{\otimes} \cdots \underset{H}{\otimes} H^{n_s}$  is equivalent as real spaces to

$$(\boldsymbol{H}^{n_1} \underset{\boldsymbol{H}}{\otimes} \boldsymbol{H}^{n_2}) \underset{\boldsymbol{R}}{\otimes} \cdots \underset{\boldsymbol{R}}{\otimes} (\boldsymbol{H}^{n_{s-1}} \underset{\boldsymbol{H}}{\otimes} \boldsymbol{H}^{n_s})$$

since the complexifications are isomorphic over C.

Let  $\rho_1, \dots, \rho_s$  be linear representations of Lie groups  $G_1, \dots, G_s$  on  $F^{n_1}, \dots, F^{n_s}$  over F respectively. If  $F = \mathbb{R}$  or  $\mathbb{C}$ , then the exterior tensor product  $\rho_1 \stackrel{\diamond}{\triangleright} \cdots \stackrel{\diamond}{\triangleright} \rho_s$  over F is defined as the representation of the direct product group  $G_1 \times \cdots \times G_s$  on the tensor prodict space  $F^{n_1} \stackrel{\diamond}{\triangleright} \cdots \stackrel{\diamond}{\triangleright} F^{n_s}$  over F such that

$$(\rho_1 \stackrel{\diamondsuit}{\underset{F}} \cdots \stackrel{\diamondsuit}{\underset{F}} \rho_s)(g_1, \cdots, g_s) := \rho_1(g_1) \stackrel{\diamondsuit}{\underset{F}} \cdots \stackrel{\diamondsuit}{\underset{F}} \rho_s(g_s)$$

for  $(g_1, \dots, g_s)$  in  $G_1 \times \dots \times G_s$ , where the right hand side is the usual tensor product of linear transformations. If F = H, then note that  $\tilde{J}$  commutes with the representation  $(k \circ \rho_1)$   $\hat{\otimes}_C \cdots \hat{\otimes}_C (k \circ \rho_s)$  of  $G_1 \times \dots \times G_s$  on  $h(H^{n_1}) \hat{\otimes}_C \cdots \hat{\otimes}_C h(H^{n_s})$ . The exterior tensor product  $\rho_1 \hat{\otimes}_H \cdots \hat{\otimes}_H \rho_s$  over right H is defined as the representation of  $G_1 \times \dots \times G_s$  on  $H^{n_1} \hat{\otimes}_H \cdots \hat{\otimes}_H H^{n_s}$  such that

$$(\rho_1 \overset{\hat{\otimes}}{\underset{H}{\otimes}} \cdots \overset{\hat{\otimes}}{\underset{H}{\otimes}} \rho_s)(g_1, \cdots, g_s) := ((k \circ \rho_1) \overset{\hat{\otimes}}{\underset{C}{\otimes}} \cdots \overset{\hat{\otimes}}{\underset{C}{\otimes}} (k \circ \rho_s))(g_1, \cdots, g_s) | \boldsymbol{H}^{n_1} \overset{\hat{\otimes}}{\underset{H}{\otimes}} \cdots \overset{\hat{\otimes}}{\underset{H}{\otimes}} \boldsymbol{H}^{n_s}.$$

If s is even, then it is equivalent as a real representation of  $G_1 \times \cdots \times G_s$  to  $(\rho_1 \stackrel{\triangle}{\underset{R}{\otimes}} \rho_2) \stackrel{\triangle}{\underset{R}{\otimes}} \cdots \stackrel{\triangle}{\underset{R}{\otimes}} (\rho_{s-1} \stackrel{\triangle}{\underset{R}{\otimes}} \rho_s)$ . Next, we study the case of s=2 in more detail. The *identity representation* of a Lie subgroup K of GF(n) is denoted by id. We consider the action (3.1) of K on pF(n).

PROPOSITION 3.3 If K is a Lie subgroup of  $GF(n_2)$  and  $n_1 \ge n_2$ , then (1)  $\operatorname{coh}(GF(n_1) \times K, \operatorname{id} \bigotimes_F^{n_1} F^{n_2}) = \operatorname{coh}(K, pF(n_2)),$  (2)  $\operatorname{coh}(SO(n_1) \times K, \operatorname{id} \bigotimes_R^{n_1} F^{n_2}) = \operatorname{coh}(K, pR(n_2)),$  (3) If  $n_1 > n_2$ , then  $\operatorname{coh}(SU(n_1) \times K, \operatorname{id} \bigotimes_C^{n_1} F^{n_2}) = \operatorname{coh}(K, pC(n_2)),$  (4)  $\operatorname{coh}(K, pF(n_2)) \ge \operatorname{coh}(GF(n_2), pF(n_2)) = n_2 = \operatorname{coh}(SF(n_2), pF(n_2))$  if F = R or C.

PROOF: If  $F = \mathbf{R}$  or C, the representation space  $F^{n_1} \underset{F}{\otimes} F^{n_2}$  is identified with  $F(n_1, n_2)$  by the correspondence  $i: F^{n_1} \underset{F}{\otimes} F^{n_2} \to F(n_1, n_2)$  such that  $\iota(e_i \otimes e_j) = E_{ij}$   $(i = 1, \dots, n_1; j = 1, \dots, n_2)$  with respect to the standard bases  $\{e_i\}$ ,  $\{e_j\}$ ,  $\{E_{ij}\}$  of  $F^{n_1}$ ,  $F^{n_2}$ ,  $F(n_1, n_2)$  respectively. Through  $\iota$ , the action of  $GF(n_1) \times K$  on  $F(n_1, n_2)$  is induced as

$$(A, B) \cdot X = AX^tB$$

for  $X \in F(n_1, n_2)$ ,  $(A, B) \in GF(n_1) \times K$ . The o.t.g. induced from this action is equivalent to one from the similar action of  $GF(n_1) \times \overline{K}$  where  $\overline{K} = \{\overline{B}; B \in K\}$  is the conjugation of  $K \in GF(n_2)$ . Hence the o.t.g. induced from id  $\widehat{\otimes}_F$  id is equivalent to one from the action (3.2) of  $GF(n_1) \times K$ . When F = H, we consider  $\iota$ :  $C^{2n_1} \otimes C^{2n_2} \to C(2n_1, 2n_2)$  for the standard basis  $e_1 = h(e'_1), \dots, e_{n_i} = h(e'_{n_i}), e_{n_i+1} = h(e'_1j), \dots, e_{2n_i} = h(e'_{n_i}j)$  of  $C^{2n_i}$  where  $e'_1, \dots, e'_{n_i}$  is the standard basis of  $H^{n_i}$  (i=1, 2). Then we have

$$\iota(\boldsymbol{H}^{n_1} \bigotimes_{\boldsymbol{H}} \boldsymbol{H}^{n_2}) = k(\boldsymbol{H}(n_1, n_2))$$

since  $\tilde{J}Z_i = J_i\bar{Z}_i$   $(Z_i \in C^{2n_i})$ ,  $\iota(\tilde{J}Z) = J_1\bar{\iota(Z)}^tJ_2$   $(Z \in C^{2n_1} \otimes C^{2n_2})$  and  $k(\boldsymbol{H}(n_1, n_2)) = \{X \in \boldsymbol{C}(2n_1, 2n_2); J_1\bar{X}^tJ_2 = X\}$  where

$$J_i = \begin{pmatrix} 0_{n_i} & -I_{n_i} \\ I_{n_i} & 0_{n_i} \end{pmatrix} \qquad (i = 1, 2).$$

Through i, the action of  $Sp(n_1) \times K$  on  $k(\boldsymbol{H}(n_1, n_2))$  is induced from the representation  $id \underset{\boldsymbol{H}}{\hat{\otimes}} id$  on  $\boldsymbol{H}^{n_1} \underset{\boldsymbol{H}}{\otimes} \boldsymbol{H}^{n_2}$  by  $(A, B) \cdot k(X) = k(A)k(X)^t k(B)$  for  $X \in \boldsymbol{H}(n_1, n_2)$ ,  $(A, B) \in Sp(n_1) \times K$ . The o.t.g. induced from this action is equivalent to the one which is induced from the action (3.2) of  $Sp(n_1) \times K$  on  $\boldsymbol{H}(n_1, n_2)$ , since  $\overline{k(B)} = k(\overline{B})$  and  $k(A)k(X)k(\overline{B}) = k(AX^t\overline{B})$ .

Then (1) follows from Lemma 3.1 and Lemma 3.2(0), (1), (2), since  $MF(n_1, n_2)$  is open and dense in  $F(n_1, n_2)$ . (2) follows from (1) since  $GR(n_1)^0 = SO(n_1)$ . (3) follows from Lemma 3.1 and Lemma 3.2(0), (1), (3). (4) follows from that  $GF(n_2)$  (resp.  $SF(n_2)$  if F = R or C) transforms any matrix in  $pF(n_2)$  to a diagonal form. Q.E.D.

Denote  $r(n_1, n_2, n_3) = \cosh(SO(n_1) \times SO(n_2) \times SO(n_3)$ ,  $id \bigotimes_{R} id \bigotimes_$ 

#### Proposition 3.4

- (1)  $r(n_1, n_2, n_3) \ge 18$  if  $n_1 \ge n_2 \ge n_3 \ge 3$ .
- (2)  $c(n_1, n_2, n_3) \ge 6$  if  $n_1 \ge n_2 \ge n_3 \ge 2$ .
- (3)  $q(n_1, n_2, n_3) \ge 3$  if  $n_3 \ge 3$ ,  $n_1 \ge n_2 \ge 1$ .
- (4)  $q(n_1, n_2, n_3) \ge 8$  if  $n_3 \ge 3$ ,  $n_1 \ge 2$ ,  $n_1 \ge n_2 \ge 1$ .

PROOF: Denote  $\lambda(n_1, n_2, n_3) = \dim pB(n_2n_3) - \dim SO(n_2) \times SO(n_3)$  (if  $n_1 \ge n_2n_3$ ) or  $\dim \mathbb{R}^{n_1} \otimes \mathbb{R}^{n_2} \otimes \mathbb{R}^{n_3} - \dim SO(n_1) \times SO(n_2) \times SO(n_3)$  (otherwise),  $\kappa(n_1, n_2, n_3) = \dim pC(n_2n_3) - \dim SU(n_2) \times SU(n_3)$  (if  $n_1 \ge n_2n_3$ ) or  $\dim \mathbb{C}^{n_1} \otimes \mathbb{C}^{n_2} \otimes \mathbb{C}^{n_3} - \dim U(n_1) \times SU(n_2) \times SU(n_3)$  (otherwise), and  $\mu(n_1, n_2, n_3) = \dim pR(4n_1n_2) - \dim Sp(n_1) \times Sp(n_2)$  (if  $n_3 \ge 4n_1n_2$ ),  $\dim pH(n_2n_3) - \dim Sp(n_2) \times SO(n_3)$  (if  $n_3 \le 4n_1n_2$ ,  $n_2n_3 \le n_1$ ) or  $\dim (H^{n_1} \otimes H^{n_3}) \otimes R^{n_3} - \dim Sp(n_1) \times Sp(n_2)$   $\times SO(n_3)$  (otherwise). Then  $\lambda(n_1, n_2, n_3) \le r(n_1, n_2, n_3)$ ,  $\kappa(n_1, n_2, n_3) \le r(n_1, n_2, n_3) \le r(n_1, n_2, n_3) \le r(n_1, n_2, n_3)$  and  $\mu(n_1, n_2, n_3) \le q(n_1, n_2, n_3)$  by Prop. 3.3 since  $(H^{n_1} \otimes H^{n_2}) \otimes R^{n_3}$  is equivalent to  $H^{n_1} \otimes (H^{n_2} \otimes R^{n_3})$  as  $Sp(n_1) \times Sp(n_2) \times SO(n_3)$ -spaces over R. Since  $\lambda(x_1, x_2, x_3) = (x_2^2 x_3^2 + x_2 x_3 - x_2^2 - x_3^2 + x_2 + x_3)/2$  (if  $x_1 \ge x_2 x_3$ ) or  $x_1 x_2 x_3 + (x_1 + x_2 + x_3 - x_1^2 - x_2^2 - x_3^2)/2$  (otherwise),  $\kappa(x_1, x_2, x_3) = 8x_1^2 x_2^2 + 2x_1 x_2 - 2x_1^2 - 2x_2^2 - x_1 - x_2$  (if  $x_1 \ge x_2 x_3$ ) or  $2x_1 x_2 x_3 - x_1^2 - x_2^2 - x_3^2 + 2$  (otherwise), and  $\mu(x_1, x_2, x_3) = 8x_1^2 x_2^2 + 2x_1 x_2 - 2x_1^2 - 2x_2^2 - x_1 - x_2$  (if  $x_3 \ge 4x_1 x_2$ ),  $2x_3^2 x_2^2 - x_3 x_2 - 2x_2^2 - x_2 - x_3^2/2 + x_3/2$  (if  $x_3 \le 4x_1 x_2$ ,  $x_3 x_2 \le x_1$ ) or  $4x_1 x_2 x_3 - x_1 (2x_1 + 1) - x_2 (2x_2 + 1) - x_3^2/2 + x_3/2$  (otherwise), they define continuous piecewise polynomial functions on  $R^3$  if we take  $x_i (i = 1, 2, 3)$  as real numbers. (1) Since  $\partial \lambda/\partial x_i(x_1, x_2, x_3) \ge 0$  for  $x_1 \ge x_2 \ge x_3 \ge 1$  (i = 1, 2, 3), we have  $\lambda(n_1, n_2, n_3) \ge \lambda(n_1, n_2, 3) \ge \lambda(n_1$ 

3, 3)  $\geq \lambda(3, 3, 3) = 18$ . (2) Similar to (1),  $\kappa(n_1, n_2, n_3) \geq \kappa(2, 2, 2) = 6$ . (3) Since  $\partial \mu/\partial x_i(x_1, x_2, x_3) \geq 0$  for  $i = 1, 2, 3; x_1, x_2, x_3 \geq 1$  (if  $x_3 \geq 4x_1x_2$  or  $x_3x_2 \leq x_1$ ), and  $\partial \mu/\partial x_3(x_1, x_2, x_3) = (4x_1x_2 - x_3) + 1/2 > 1/2$ ,  $\partial \mu/\partial x_2(x_1, x_2, x_3) = 4(x_1x_3 - x_2) - 1 \geq 4x_1(x_3 - 1) - 1 \geq 3$ ,  $\partial \mu/\partial x_1(x_1, x_2, x_3) = 4(x_2x_3 - x_1) - 1 > -1$  for  $x_1 \geq x_2 \geq 1$ ,  $x_3 \geq 2$  (if  $x_3 < 4x_1x_2$  and  $x_3x_2 > x_1$ ), we have  $\mu(n_1, n_2, n_3) \geq \mu(n_1, n_2, n_3) \geq \mu(n_1, 1, 3) = \mu(n_1 - 1, 1, 3) + \partial \mu/\partial x_1(n_1 - \theta, 1, 3)$  (since  $\mu(n_1, 1, 3) = \mu(n_1 - 1, 1, 3)$  are integers, and  $-1 < \partial \mu/\partial x_1$  is also an integer, especially  $\partial \mu/\partial x_1 \geq 0 \geq \mu(1, 1, 3) = 3$ . (4) Similar to (3),  $\mu(n_1, n_2, n_3) \geq \mu(n_1, 1, 3) \geq \mu(2, 1, 3) = 8$ . Q.E.D.

Let L be the Lie algebra of a connected Lie group G. We write the same letter for a linear representation of L and the corresponding representation of G. According to Iwahori [12], there is the following relation between real irreducible representations of L(resp. G) and complex irreducible representations of L(resp. G) (cf. Goto-Grosshans [6]). For a complex irreducible representation  $\rho$  on a complex vector space V, we denote the real restriction of  $\rho$  on the real restricted vector space  $V_R$  (abbrev. V since  $V = V_R$  as a set) by  $\rho_R$  (abbrev.  $\rho$ ), which is not real irreducible if and only if  $\rho$  is 'real', and so we attach to  $\rho$ a real irreducible representation  $\rho^r$  as follows.  $\rho^r = \sigma$  (if  $\rho$  is the complexification  $\sigma^c$  of a real representation  $\sigma$  on a real form W of V, i.e.,  $\rho$  is 'real'.) or  $\rho_R$  (otherwise). Note that  $\rho_1^r$  and  $\rho_2^r$  are equivalent as real representations if and only if  $\rho_1$  and  $\rho_2$  are conjugate or equivalent as complex representations of L(resp. G). Conversely the complexification  $\sigma^c$  on  $W^c$  of a real irreducible representation  $\sigma$  on a real vector space W is not complex irreducible if and only if W has a L(resp. G)-invariant complex structure (then it is unique), and so we attach to  $\sigma$  a complex irreducible representation  $\sigma^c$  as follows.  $\sigma^c = \sigma$  (if W has a L(resp. G)invariant complex structure) or  $\sigma^{C}$  (otherwise). Note that  $\rho^{rc}$  and  $\rho$ (resp.  $\sigma^{cr}$  and  $\sigma$ ) are equivalent as complex(resp. real) representations.

Let  $(G, \mathbf{E}^N)$  be an o.t.g. Then the Lie algebra L of G is a real reductive Lie algebra and has a form:

$$L = L_0 \oplus L_1 \oplus \cdots \oplus L_s \tag{3.4}$$

where  $L_0$  is the center of L, and  $L_i(i=1,\dots,s)$  are simple ideals of L. Let  $G_0$ ,  $G_i$  be connected Lie subgroups of G corresponding to  $L_0$ ,  $L_i$  respectively and  $\tilde{G}_0$ ,  $\tilde{G}_i$  be the universal covering groups of  $G_0$ ,  $G_i$  respectively, then  $\tilde{G}_i$  ( $i=1,\dots,s$ ) are compact. Let  $id:G\to SO(N)$  be the identity representation and  $\tilde{id}$  be the corresponding representation of  $\tilde{G}:=\tilde{G}_0\times \tilde{G}_1\times \cdots \times \tilde{G}_s$ .

In this paper, we consider  $(G, \mathbf{E}^N)$  in case that id is a real irreducible representation of G. Then G is compact (cf. Kobayashi-Nomizu[14]), and so  $G_0 \simeq U(1)$  or the trivial group 1. For  $t \in \mathbf{R}^\times := \mathbf{R} - \{0\}$ , we denote  $\hat{t}: \mathbf{R} \to U(1)$  the complex irreducible representation of  $\mathbf{R}$  such that  $\hat{t}(x) = e^{2\pi i t x}$  for  $x \in \mathbf{R}$ . We shall decompose id of G into an exterior tensor product of complex irreducible representations of  $G_i(i=0,\cdots,s)$ .

Case i)  $\widetilde{id}$   $\stackrel{c}{=}$   $\widetilde{id}$   $\stackrel{c}{:}$  Then  $G_0$  is trivial, and  $(\widetilde{G}, \widetilde{id}$   $\stackrel{c}{:}, C^N)$  is equivalent as complex representations to some

$$(\tilde{G}_1 \times \cdots \times \tilde{G}_s, \rho_1 \hat{\otimes} \cdots \hat{\otimes} \rho_s, C^{n_1} \hat{\otimes} \cdots \hat{\otimes} C^{n_s})$$

where  $\rho_i$  is a self-conjugate complex irreducible representation of  $\tilde{G}_i$  on  $C^{n_i}$ ,  $n_i \ge 2(i=1, \dots, s)$ ,  $\prod_{i=1}^s n_i = N$ , and  $\#\{i; \rho_i \text{ is 'quaternion'}\}$  is even. We may assume  $\rho_j(j=1, \dots, 2r)$  are 'quaternion' and  $\rho_k(k=2r+1, \dots, 2r+q; s=2r+q)$  are 'real', and  $\sigma_i$  denotes a real representation of  $\tilde{G}_i$  on  $\mathbb{R}^{n_i}$  whose complexification is  $\rho_{2r+i}(i=1, \dots, q)$ ; where r and q are non-negative integers. Then  $n_{2r+i} \ge 3(i=1, \dots, q)$ , and  $(\tilde{G}, id, \mathbb{R}^N)$  is equivalent as real representation to

$$(\tilde{G}_{1} \times \cdots \times \tilde{G}_{2r} \times \tilde{G}_{2r+1} \times \cdots \times \tilde{G}_{2r+q}, (\rho_{1} \overset{\triangle}{\otimes} \rho_{2}) \overset{\triangle}{\otimes} \cdots \overset{\triangle}{\otimes} (\rho_{2r-1} \overset{\triangle}{\otimes} \rho_{2r}) \overset{\triangle}{\otimes} \sigma_{1} \overset{\triangle}{\otimes} \cdots \overset{\triangle}{\otimes} \sigma_{q},$$

$$(\boldsymbol{H}^{n_{1}/2} \overset{\triangle}{\otimes} \boldsymbol{H}^{n_{2}/2}) \overset{\triangle}{\otimes} \cdots \overset{\triangle}{\otimes} (\boldsymbol{H}^{n_{2r-1}/2} \overset{\triangle}{\otimes} \boldsymbol{H}^{n_{2r/2}}) \overset{\triangle}{\otimes} \boldsymbol{H}^{n_{2r+1}} \overset{\triangle}{\otimes} \cdots \overset{\triangle}{\otimes} \boldsymbol{R}^{n_{2r+q}})$$
(3.5)

Case ii)  $\widetilde{id}^c = \widetilde{id}$ ,  $G_0 \simeq U(1)$ : Then  $(\widetilde{G}, \ \widetilde{id}^c, \ C^{N/2})$  is equivalent as complex representations to some

$$(\mathbf{R} \times \widetilde{G}_1 \times \cdots \times \widetilde{G}_s, \widehat{t} \stackrel{\wedge}{\otimes} \rho_1 \stackrel{\wedge}{\otimes} \cdots \stackrel{\wedge}{\otimes} \rho_s, \mathbf{C} \stackrel{\sim}{\otimes} \mathbf{C}^{n_1} \stackrel{\sim}{\otimes} \cdots \stackrel{\sim}{\otimes} \mathbf{C}^{n_s})$$

where  $t \in \mathbb{R}$ ,  $\rho_i$  is a complex irreducible representation of  $\widetilde{G}_i$  on  $C^{n_i}$ ,  $n_i \ge 2(i=1, \dots, s)$  and  $\prod_{i=1}^s n_i = N/2$ . So  $(\widetilde{G}, \widetilde{id}, \mathbb{R}^N)$  is equivalent as real representation to

$$(\mathbf{R} x \tilde{G}_1 x \cdots x \tilde{G}_s, (\hat{t} \hat{\otimes} \rho_1 \hat{\otimes} \cdots \hat{\otimes} \rho_s)_{\mathbf{R}}, (\mathbf{C} \hat{\otimes} \mathbf{C}^{n_1} \hat{\otimes} \cdots \hat{\otimes} \mathbf{C}^{n_s})_{\mathbf{R}})$$
(3.6)

Case iii)  $\widetilde{id}^c = \widetilde{id}$ ,  $G_0 \simeq 1$ : Then  $(\widetilde{G}, \ \widetilde{id}^c, C^{N/2})$  is equivalent as complex representations to some

$$(\tilde{G}_1 \times \cdots \times \tilde{G}_s, \rho_1 \stackrel{>}{\otimes} \cdots \stackrel{>}{\otimes} \rho_s, C^{n_1} \stackrel{>}{\otimes} \cdots \stackrel{>}{\otimes} C^{n_s})$$

where  $\rho_i$  is a complex irreducible representation of  $\tilde{G}_i$  on  $C^{n_i}$ ,  $n_i \ge 2$   $(i=1, \dots, s)$  and  $\prod_{i=1}^s n_i = N/2$ . So  $(\tilde{G}, \tilde{id}, \mathbb{R}^N)$  is equivalent as real representation to

$$(\tilde{G}_1 \times \cdots \times \tilde{G}_s, (\rho_1 \stackrel{\Diamond}{\otimes} \cdots \stackrel{\Diamond}{\otimes} \rho_s)_R, C^{n_1} \stackrel{\Diamond}{\otimes} \cdots \stackrel{\Diamond}{\otimes} C^{n_s})_R)$$
(3.7)

where  $\rho_1 \stackrel{\diamond}{\otimes} \cdots \stackrel{\diamond}{\otimes} \rho_s$  is not 'real' since  $(\rho_1 \stackrel{\diamond}{\otimes} \cdots \stackrel{\diamond}{\otimes} \rho_s)_R$  is real irreducible.

THEOREM 3.5 Let  $(G, \mathbf{E}^N)$  be an o.t.g. of cohomogeneity at most 3. If id:  $G \to SO(N)$  is real irreducible and  $s \ge 3$  (cf. (3.4)), then  $(\tilde{G}, \tilde{id}, \mathbf{R}^N)$  is equivalent as real representation to

$$(\tilde{A}_1 \times \tilde{A}_1 \times \tilde{A}_1, (\Lambda_1 \stackrel{\wedge}{\otimes} \Lambda_1) \stackrel{\wedge}{\otimes} (2\Lambda_1)^r, (\mathbf{H} \stackrel{\wedge}{\otimes} \mathbf{H}) \stackrel{\wedge}{\otimes} \mathbf{R}^3)$$
(3.8)

Especially coh  $(G, \mathbf{E}^N) = 3$ .

PROOF: Suppose id is real irreducible and  $s \ge 3$ . Then  $O(G, id, \mathbb{R}^N)$  is contained in (1)  $O((Sp(n_1/2) \times Sp(n_2/2)) \times SO(n_3), (id \underset{H}{\hat{\otimes}} id) \underset{R}{\hat{\otimes}} id, (\mathbb{H}^{n_1/2} \underset{H}{\otimes} \mathbb{H}^{n_2/2}) \underset{R}{\otimes} \mathbb{R}^{n_3})$  for some  $n_1, n_2 \ge 2, n_3 \ge 3; N = n_1 n_2 n_3, (2) O(SO(n_1) \times SO(n_2) \times SO(n_3), id \underset{R}{\hat{\otimes}} id \underset{R}{\hat{\otimes}} id, \mathbb{R}^{n_1} \underset{R}{\otimes} \mathbb{R}^{n_2} \underset{R}{\otimes} \mathbb{R}^{n_3})$  for some  $n_1, n_2 \ge 3$ .

Suppose s=2:  $L=L_0 \oplus L_1 \oplus L_2$  (cf. (3.4)). Then  $(\tilde{G}, \tilde{id}, \mathbb{R}^N)$  is equivalent as real representation to one of the followings:

Type I)  $(\tilde{G}_1 \times \tilde{G}_2, \rho_1^r \bigotimes_{R}^c \rho_2^r, R^{n_1} \bigotimes_{R}^{n_2}); n_1 \ge n_2 \ge 3, N = n_1 n_2, \rho_i \text{ is a 'real' complex irreducible representation of } \tilde{G}_i \text{ on } C^{n_i}, R^{n_i} \text{ is a } \tilde{G}_i \text{-invariant real form of } C^{n_i}(i=1,2).$ 

Type II)  $(\tilde{G}_1 \times \tilde{G}_2, \rho_1 \overset{\diamondsuit}{\underset{H}{\otimes}} \rho_2, \boldsymbol{H}^{n_1} \overset{\diamondsuit}{\underset{H}{\otimes}} \boldsymbol{H}^{n_2}); n_1 \geq n_2 \geq 1, N = 4n_1n_2, \rho_i \text{ is a 'quaternion' complex irreducible representation of } G_i \text{ on } C^{2n_i}, \text{ and } \boldsymbol{H}^{n_i} \text{ is } C^{2n_i} \text{ with the } G_i \text{-invariant quaternionic structure (i.e., the right multiplication of } j)(i=1, 2).$ 

Type III)  $(\mathbf{R} \times \tilde{G}_1 \times \tilde{G}_2, (t \overset{\diamondsuit}{\otimes} \rho_1 \overset{\diamondsuit}{\otimes} \rho_2)_{\mathbf{R}}, (\mathbf{C} \overset{\smile}{\otimes} \mathbf{C}^{n_1} \overset{\smile}{\otimes} \mathbf{C}^{n_2})_{\mathbf{R}}); n_1 \geq n_2 \geq 2, N = 2n_1n_2, \rho_i \text{ is a complex irreducible representation of } \tilde{G}_i (i=1,2), t \in \mathbf{R}^{\times}.$ 

Type IV)  $(\tilde{G}_1 \times \tilde{G}_2, (\rho_1 \overset{\diamond}{\otimes} \rho_2)_R, (C^{n_1} \overset{\diamond}{\otimes} C^{n_2})_R); n_1 \geq n_2 \geq 2, N = 2n_1n_2, \rho_i \text{ is a complex irreducible representation of } G_i \text{ on } C^{n_i}(i=1,2), \text{ and } \rho_1 \otimes \rho_2 \text{ is not 'real'}.$ 

LEMMA 3.6 Let  $\rho_i$  be a linear representation on  $F^{m_i}$  of a compact Lie group  $K_i$ , and denote  $d_i=2^i m_i$ —dim  $K_i$  where i=0 (if F=R), 1(if F=C), or 2(if F=H). Then

- (1) If  $1 \le n < m_i$ , then doh  $(K_i \times GF(n), \rho_i \underset{F}{\Diamond} id, F^{m_i} \underset{F}{\otimes} F^n) \ge d_i + n \{2^{i-1}(n-3)\} + 1\} (\ge d_i + 3)$  if moreover  $n \ge 3$ .
- (2) If  $1 \le n < m_i$ , then  $\operatorname{doh}(K_i \times GF(n), \rho_i \bigotimes_F^{ii} id, F^{m_i} \bigotimes_F^{i} F^n) \ge d_i + 2^{i-1} \{n(n-1) 2\} + n$  ( $\ge d_i + 2$  if moreover  $n \ge 2$  and  $i \ge 1$ ).

PROOF: doh  $(K_i \times GF(n), \rho_i \overset{\diamond}{\underset{F}{\otimes}} id, F^{m_i} \overset{\diamond}{\underset{F}{\otimes}} F^n) \ge \dim F^{m_i} \overset{\diamond}{\underset{F}{\otimes}} F^n - \dim K_i \times GF(n) = d_i + 2^i (n-1) \cdot m_i - (2^i - 1)n - 2^{i-1}n(n-1)$ . Replacing  $m_i$  by n(resp. n+1), we have (1)(resp. (2)). Q.E.D.

Suppose s=1:  $L=L_0 \oplus L_1$  (cf. (3.4)). Then  $(\tilde{G}, \tilde{id}, \mathbb{R}^N)$  is equivalent as real representation to one of the followings:

TYPE V)  $(\tilde{G}_1, \rho_1^r, \mathbf{R}^{n_1})$ ;  $n_1 \ge 3$ ,  $N = n_1$ ,  $\rho_1$  is a 'real' complex irreducible representation of  $\tilde{G}_1$  on  $\mathbf{C}^{n_1}$ , and  $\mathbf{R}^{n_1}$  is a  $\tilde{G}_1$ -invariant real form of  $\mathbf{C}^{n_1}$ .

Type VI)  $(\mathbf{R} \times \tilde{G}_1, (\hat{t} \overset{\diamondsuit}{\otimes} \rho_1)_{\mathbf{R}}, (\mathbf{C} \overset{\diamondsuit}{\otimes} \mathbf{C}^{n_1})_{\mathbf{R}}); n_1 \geq 2, N = 2n_1, \text{ and } \rho_1 \text{ is a complex irreducible representation of } \tilde{G}_1 \text{ on } \mathbf{C}^{n_1}.$ 

Type VII)  $(\tilde{G}_1, \rho_1, C^{n_1})$ ;  $n_1 \ge 2$ ,  $N = 2n_1$ ,  $\rho_1$  is a complex irreducible representation of  $G_1$  on  $C^{n_1}$ , and  $\rho_1$  is not 'real'.

LEMMA 3.7 If  $n_1 \le n_2$ , then  $GF(n_1) (\simeq GF(n_1) \times \{I_{n_2}\})$  in  $GF(n_1) \times GF(n_2)$  transforms any matrix  $X = {}^t[x_1, \dots, x_{n_1}] \in F(n_1, n_2) (x_i \in F^{n_2} \text{ for } i = 1, \dots, n_1)$  to a form  $Y = {}^t[y_1, \dots, y_n] \in F(n_1, n_2) ({}^ty_i \in F(1, n_2) \text{ for } i = 1, \dots, n_1)$  such that  ${}^ty_i \bar{y}_j = c_i \delta_{ij}$  for some  $c_i \in R$   $(i, j = 1, \dots, n_1)$  by the action (3.2).

PROOF: There is  $A \in GF(n_1)$  such that A transforms  $X^t \bar{X} \in pF(n_1)$  to a diagonal

form 
$$\begin{pmatrix} c_1 \\ \ddots \\ c_{n_1} \end{pmatrix}$$
 by the action(3.1).

Then Y=AX satisfied the desired property. Q.E.D.

Suppose s=0:  $L=L_0$  (cf. (3.4)). Then  $(G, id, \mathbb{R}^N)$  is equivalent as real representation to one of the followings:

TYPE VIII)  $(R, \hat{t}_R, C_R); t \in R^{\times}$ .

TYPE IX)  $(1, 0, \mathbf{R})$ ; 1 is the trivial group, and 0 is the trivial representation on  $\mathbf{R}$ . Note that the o.t.g. of type VIII is equivalent to  $O(SO(2), id, \mathbf{R}^2)$ .

For general  $s \ge 0$ , the estimate of coh  $(G, \mathbf{E}^N)$  is given in each cases i), ii), iii), if  $id: G \to SO(N)$  is real irreducible, by the following theorem. If moreover  $s \ge 3$ , especially we have coh  $(G, \mathbf{E}^N) \ge s$ .

THEOREM 3.8

- (1) In case i),  $\cosh(G, \mathbf{E}^N) = \cosh of(3.5) \ge 4^r \cdot 3^q 6r 3q$ ,
- (2) In case ii),  $coh(G, \mathbf{E}^N) = coh of(3.6) \ge 2^{s+1} 3s 1$ ,
- (3) In case iii),  $\cosh(G, \mathbf{E}^N) = \cosh of(3.7) \ge 2^{s+1} 3s 1$ .

PROOF: (3) follows from (2). For (2), we may assume  $n_1 \ge \cdots \ge n_s \ge 2$ . If s < 3, then (2) is trivial. Suppose  $s \ge 3$ . If  $n_1 \ge n_2 \cdots n_s$ , then we denote  $f(n_1, \dots, n_s) = \dim pC(n_2 \cdots n_s) - \dim SU(n_2) \times \cdots \times SU(n_s) = n_2^2 \cdots n_s^2 - n_2^2 - \cdots - n_s^2 + s - 1$ . Then  $\partial f/\partial n_i = 2n_i(n_2^2 \cdots \hat{n}_i^2 \cdots n_s^2 - 1)$  or  $0 \ge 0$ . If  $n_1 \le n_2 \cdots n_s$ , then we denote  $f(n_1, \dots, n_s) = \dim C^{n_1} \otimes \cdots \otimes C^{n_s} - \dim U(n_1) \times SU(n_2) \times \cdots \times SU(n_s) = 2n_1 \cdots n_s - n_1^2 - \cdots - n_s^2 + s - 1$ . Then  $\partial f/\partial n_i = 2(n_1 \cdots \hat{n}_i \cdots n_s - n_i) \ge 2(n_2 \cdots n_s - n_1) \ge 0$ . Therefore  $\cosh(3.6) \ge f(n_1, \dots, n_s) \ge f(2, \dots, 2) = 2^{s+1} - 3s - 1$ .

(1) Suppose  $s=2r+q\leq 2$ . If  $r,q\leq 1$ , then (1) is trivial. If r=0, q=s=2, then (1) follows from Prop. 3.3. If s=3, then (1) follows from Prop. 3.4. Assume  $s\geq 4$ . Suppose r=0: Then we may assume  $n_1\geq \cdots \geq n_s\geq 3$ . If  $n_1\geq n_2\cdots n_s$ , then denote  $f(n_1,\cdots,n_s)=\dim p\mathbf{R}(n_2\cdots n_s)-\dim SO(n_2)\times \cdots \times SO(n_s)=(n_2^2\cdots n_s^2+n_2\cdots n_s-n_2^2-\cdots n_s^2+n_2+\cdots +n_s)/2$ . Then  $\partial f/\partial n_i=n_i(n_2^2\cdots \hat{n_i}^2\cdots n_s^2-1)+(n_2\cdots \hat{n_i}^2\cdots n_s+1)/2$  or  $0\geq 0$ . If  $n_1\leq n_2\cdots n_s$ , then denote  $f(n_1,\cdots,n_s)=\dim \mathbf{R}^{n_1}\otimes \cdots \otimes \mathbf{R}^{n_s}-\dim SO(n_1)\times \cdots \times SO(n_s)=n_1\cdots n_s-(n_1^2+\cdots+n_s^2)/2+(n_1+\cdots+n_s)/2$ . Then  $\partial f/\partial n_i=n_1\cdots \hat{n_i}\cdots n_s-n_i+1/2\geq n_2\cdots n_s-n_1+1/2\geq 1/2$ . Therefore coh  $(3.5)\geq f(n_1,\cdots,n_s)\geq f(3,\cdots,3)=3^s-3s=3^q-3q$ . Suppose q=0: Then we may assume  $n_1\geq \cdots \geq n_s\geq 2$ . If  $n_1n_2\geq n_3\cdots n_s$ , then denote  $g(n_1,\cdots,n_s)=\dim$ 

 $Sp(n_3/2) \times \cdots \times Sp(n_s/2) = (n_3^2 \cdots n_s^2 + n_3 \cdots n_s - n_3^2 - \cdots - n_s^2 - n_3 - \cdots$  $p\mathbf{R}(n_3\cdots n_s)$  – dim  $-n_s$ )/2. Since  $\partial g/\partial n_i \ge 0$  ( $i=1, \dots, s$ ), coh (3.5)  $\ge g(n_1, n_2, n_3, \dots, n_s) \ge g(n_1, n_2, 2, \dots 2)$  $=2^{2s-5}+2^{s-3}-3(s-2)=2^{2r}(2^{2r-5}+2^{-3})-6r+6 \ge 4^r-6r$ . If  $n_1n_2 \le n_3 \cdots n_s$ , then denote  $h(n_1, \dots, n_s) = \dim \quad \mathbf{H}^{n_1/2} \underset{\mathbf{H}}{\otimes} \dots \underset{\mathbf{H}}{\otimes} \mathbf{H}^{n_s/2} - \dim Sp(n_1/2) \times \dots \times Sp(n_s/2) = n_1 \dots n_s - (n_1^2 + \dots + n_s)$  $+n_s^2+n_1+\cdots+n_s$ )/2. Since  $\partial h/\partial n_i=n_i\cdots\hat{n}_i\cdots n_s-n_i-1/2 \ge n_2\cdots n_s-n_1-1/2 \ge n_1n_2^2-n_1$  $-1/2 \ge 2 \cdot 4 - 2 - 1/2 > 0$   $(i=1, \dots, s)$ ,  $coh(3.5) \ge h(n_1, \dots, n_s) \ge h(n_3, n_3, n_3, n_4, \dots, n_s)$  $\geq h(n_4, n_4, n_4, n_5, \dots, n_s) \geq h(2, \dots, 2) = 2^s - 3s = 4^r - 6r$ . Finally suppose  $r, q \geq 1$ : Then we may assume  $n_1 \ge \cdots \ge n_{2r} \ge 2$  and  $n_{2r+1} \ge \cdots \ge n_{2r+q} \ge 3$ . If  $n_1 n_2 \ge n_3 \cdots n_s$ , then denote  $g(n_1, \dots, n_s) = \dim p\mathbf{R}(n_3 \dots n_s) - \dim Sp(n_3/2) \times \dots \times Sp(n_{2r}/2) \times SO(n_{2r+1}) \times \dots \times SO(n_{2r+q})$  $= (n_3^2 \cdots n_s^2 + n_3 \cdots n_s - n_3^2 - \cdots - n_s^2 - n_3 - \cdots - n_{2r} + n_{2r+1} + \cdots + n_{2r+q})/2. \text{ Since } \partial g/\partial n_i$  $\geq 0$   $(i=1, \dots, s)$ ,  $coh(3.5) \geq g(n_1, \dots, n_s) \geq g(n_1, n_2, 2, \dots, 2, \underbrace{3, \dots, 3}) = 2^{2r} \cdot 3^q (2^{2r-5} \cdot 3^q)$  $+2^{-5}$ )  $+6-6r-3q \ge 4^r \cdot 3^q - 6r - 3q$ . If  $n_1 n_2 \le n_3 \cdots n_s$ , then denote  $h(n_1, \dots, n_s) =$  $\dim (\boldsymbol{H}^{n_1/2} \underset{\boldsymbol{H}}{\otimes} \cdots \underset{\boldsymbol{H}}{\otimes} \boldsymbol{H}^{n_{2r}/2}) \underset{\boldsymbol{R}}{\otimes} \boldsymbol{R}^{n_{2r+1}} \underset{\boldsymbol{R}}{\otimes} \cdots \underset{\boldsymbol{R}}{\otimes} \boldsymbol{R}^{n_{2r+q}} - \dim Sp(n_1/2) \times \cdots \times Sp(n_{2r}/2) \times SO(n_{2r+1})$  $\times \cdots \times SO(n_{2r+q}) = n_1 \cdots n_s - (n_1^{k} + \cdots + n_s^{k} + n_1 + \cdots + n_{2r} - n_{2r+1} - \cdots - n_{2r+q}) /2.$  Since  $\partial h/\partial n_i \ge n_2 \cdots n_s - n_1 - 1/2 \ge n_1(n_2^2 - 1) - 1/2 \ge 2(2^2 - 1) - 1/2 > 0$ ,  $\cosh(3.5) \ge h(n_1, \dots, n_s)$  $\geq h (n_3, n_3, n_4, \dots, n_s) \geq h (n_4, n_4, n_4, n_4, n_5, \dots, n_s) \geq h (2, \dots, 2, \underbrace{3, \dots, 3}_{q}) = 4^r \cdot 3^q - 6r$ -3q. Q.E.D.

### 4. Orthogonal transformation groups of cohomogeneity at most 3

(I) Let  $(G, \mathbf{E}^N)$  be a real irreducible o.t.g. of type I.

PROPOSITION 4.1 coh  $(G, \mathbf{E}^N) \leq 3$  if and only if  $(\tilde{G}, i\tilde{d}, \mathbf{R}^N)$  is equivalent as real representation to one of the followings:

Conversely if  $(G, \mathbf{E}^N)$  is induced from (1),  $\cdots$ , (5), or (7), then  $(G, \mathbf{E}^N)$  can also be induced from  $(SO(n_1) \times SO(3), id \underset{\mathbf{R}}{\hat{\otimes}} id, \mathbf{R}^{n_1} \underset{\mathbf{R}}{\otimes} \mathbf{R}^3)$  for some  $n_1 \neq 4$ . So coh  $(G, \mathbf{E}^N) = 3$  (cf. Prop. 3.3(2)(4)). An o.t.g. induced from (6) is of coh 3. In fact Spin (7)  $\times$  SO(3) acts on  $\mathbf{R}$ (8, 3) through i by the action (3.2)(cf. Prop. 3.3 Proof), and the isotropy subgroup at

$$\begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix}$$
, where  $|x_i|$   $(i=1, 2, 3)$  are non-zero distinct real numbers, is locally

isomorphic to SU(2) (cf. Yokota [24, Theorem 5.27, Theorem 5.2]). Q.E.D.

(II) Let  $(G, E^N)$  be a real irreducible o.t.g. of type II.

PROPOSITION 4.2 coh  $(G, E^N) \le 3$  if and only if  $(\tilde{G}, i\tilde{d}, R^N)$  is equivalent as real representation to one of the followings:

$$\begin{array}{ll} \cosh=1: \ (8) & (A_1\times A_1,\ \varLambda_1 \overset{\diamondsuit}{\underset{H}{\otimes}} \varLambda_1,\ \textbf{\textit{H}}\overset{\backprime}{\underset{H}{\otimes}} \textbf{\textit{H}}), \\ & (9) & (C_k\times A_1,\ \varLambda_1 \overset{\diamondsuit}{\underset{H}{\otimes}} \varLambda_1,\ \textbf{\textit{H}}^k \overset{\backprime}{\underset{H}{\otimes}} \textbf{\textit{H}});\ k \geq 2, \\ \cosh=2: \ (10) & (C_k\times C_2,\ \varLambda_1 \overset{\diamondsuit}{\underset{H}{\otimes}} \varLambda_1,\ \textbf{\textit{H}}^k \overset{\backprime}{\underset{H}{\otimes}} \textbf{\textit{H}}^2);\ k \geq 2, \\ & (11) & (A_1\times A_1,\ 3\varLambda_1 \overset{\diamondsuit}{\underset{H}{\otimes}} \varLambda_1,\ \textbf{\textit{H}}^k \overset{\backprime}{\underset{H}{\otimes}} \textbf{\textit{H}}), \\ \cosh=3: \ (12) & (C_k\times C_3,\ \varLambda_1 \overset{\diamondsuit}{\underset{H}{\otimes}} \varLambda_1,\ \textbf{\textit{H}}^k \overset{\backprime}{\underset{H}{\otimes}} \textbf{\textit{H}}^3);\ k \geq 3, \\ & (13) & (C_k\times A_1,\ \varLambda_1 \overset{\diamondsuit}{\underset{H}{\otimes}} 3\varLambda_1,\ \textbf{\textit{H}}^k \overset{\backprime}{\underset{H}{\otimes}} \textbf{\textit{H}}^2);\ k \geq 2. \end{array}$$

PROOF: Suppose coh  $(G, \mathbf{E}^N) \leq 3$ . Then  $n_2 \leq 3$  (cf. Prop. 3.3(1)(4)). Assume  $n_2 = 3$ . Then  $(\tilde{G}_2, \rho_2, \mathbf{H}^{n_2})$  is equivalent as complex representation to  $(C_3, \Lambda_1, \mathbf{H}^3)$  owing to Prop. 2.20 and coh  $(Sp(n_1) \times A_1, id \bigotimes_{\mathbf{H}} S \Lambda_1, \mathbf{H}_1^n \bigotimes_{\mathbf{H}} \mathbf{H}^3) \geq \text{doh } (A_1, p\mathbf{H}(3)) = 12$  (cf. Prop. 3.3(1)). So  $(\tilde{G}, id, \mathbf{R}^N)$  is equivalent as real representation to (12) owing to Lemma 3.6(1)( $F = \mathbf{H}, i = 2, m_2 = n_1, n = n_2 = 3, d_i + k \{2^{i-1}(k-3)+1\} = d_2 + 3), 3 \geq \text{doh } (G, \mathbf{E}^N) \geq d_2 + 3, \text{ Prop.'s 2.4, 2.7, 2.10, 2.14, doh } (D_6 \times C_3, \Lambda_i \bigotimes_{\mathbf{H}} \Lambda_1, \mathbf{H}^{16} \bigotimes_{\mathbf{H}} \mathbf{H}^3) = 105(i = 5, 6), \text{ Prop. 2.15, Remark 2.16, doh } (E_7 \times C_3, \Lambda_6 \bigotimes_{\mathbf{H}} \Lambda_1, \mathbf{H}^{28} \bigotimes_{\mathbf{H}} \mathbf{H}^3) = 171.$ 

Assume  $n_2=2$ . Then  $(\tilde{G}_2, \rho_2, \mathbf{H}^{n_2})$  is equivalent as complex representation to  $(C_2, \Lambda_1, \mathbf{H}^2)$  or  $(A_1, 3\Lambda_1, \mathbf{H}^2)$  owing to Prop. 2.20, deg  $\rho_1=2n_1>4$  (cf. Prop. 2.20 and doh  $(A_1\times A_1, \mathbf{H}^2)$ )

 $3\Lambda_1 \overset{\hat{\otimes}}{\otimes} 3\Lambda_1, H^2 \overset{\hat{\otimes}}{\otimes} H^2) = 10$ ). So  $(\tilde{G}, i\tilde{d}, \mathbf{R}^N)$  is equivalent as real representation to (10) or (13) owing to Lemma 3.6(2)( $F = \mathbf{H}, i = 2, m_2 = n_1 > n = n_2 = 2$ ),  $3 \ge \text{doh} (G, \mathbf{E}^N) \ge d_2 + 2$ , deg  $\rho_1 > 4$ , Prop.'s 2.4, 2.7, 2.10, 2.14, doh  $(D_6 \times A_1, \Lambda_i \overset{\hat{\otimes}}{\otimes} 3\Lambda_1, H^{16} \overset{\hat{\otimes}}{\otimes} H^2) \ge \text{doh} (D_6 \times C_2, \Lambda_i \overset{\hat{\otimes}}{\otimes} \Lambda_1, H^{16} \overset{\hat{\otimes}}{\otimes} H^2) = 52(i = 5, 6)$ , Prop. 2.15, Remark 2.16, doh  $(E_7 \times A_1, \Lambda_6 \overset{\hat{\otimes}}{\otimes} 3\Lambda_1, H^{28} \overset{\hat{\otimes}}{\otimes} H^2) \ge \text{doh} (E_7 \times C_2, \Lambda_6 \overset{\hat{\otimes}}{\otimes} \Lambda_1, H^{28} \overset{\hat{\otimes}}{\otimes} H^2) = 59$ .

Assume  $n_2=1$ . Then  $(\tilde{G}_2, \rho_2, \boldsymbol{H}^{n_2})$  is equivalent as complex representation to  $(A_1, \Lambda_1, \boldsymbol{H})$  by Prop. 2.20. So  $(\tilde{G}, i\tilde{d}, \boldsymbol{R}^N)$  is equivalent as real representation to (8), (9) or (11) owing to Lemma 3.6(1)( $F=\boldsymbol{H}, i=2, m_2=n_1, n=1, d_i+n\{2^{i-1}(n-3)+1\}=d_2-3)$ ,  $3 \ge \text{doh}(G, \boldsymbol{E}^N) \ge d_2-3$ , Prop. 2.4,  $\text{coh}(A_5 \times A_1, \Lambda_3 \overset{\frown}{H} \Lambda_1, \boldsymbol{H}^{10} \overset{\frown}{H} \boldsymbol{H}) = 4(\text{cf. The linear isotropy representation of the symmetric pair <math>(E_6, SU(6) \cdot SU(1))$  of rank 4 is characterized as a real 40 dimensional irreducible almost faithful representation of  $A_5 \times A_1$  owing to Section 2), Prop.'s 2.7, 2.10, 2.14, Remark 2.13,  $\text{coh}(D_6 \times A_1, \Lambda_i \overset{\frown}{H} \Lambda_1, \boldsymbol{H}^{16} \overset{\frown}{H} \boldsymbol{H}) = 4(i=5, 6)(\text{cf. The linear isotropy representation of the symmetric pair <math>(E_7, \text{Spin}(12) \cdot Sp(1))$  of rank 4 is characterized as a real 64 dimensional irreducible almost faithful representation of  $D_6 \times A_1$  owing to Section 2), Prop. 2.15, Remark 2.16,  $\text{coh}(E_7 \times A_1, \Lambda_6 \overset{\frown}{H} \Lambda_1, \boldsymbol{H}^{28} \overset{\frown}{H} \boldsymbol{H}) = 4(\text{cf. The linear isotropy representation of the symmetric pair }(E_8, E_7 \cdot Sp(1))$  of rank 4 is characterized as a real 112 dimensional irreducible almost faithful representation of  $E_7 \times A_1$  owing to Section 2).

The linear isotropy representation of the symmetric pair  $(E_7, \operatorname{Spin}(12) \cdot \operatorname{Sp}(1))$  of rank 4 is characterized as a real 64 dimensional irreducible almost faithful representation of  $D_6 \times A_1$  owing to Section 2), Prop. 2.15, Remank 2.16, coh  $(E_7 \times A_1, A_6 \bigotimes_{H} A_1, H^{28} \bigotimes_{H} H) = 4(\text{cf. The linear isotropy representation of the symmetric pair } (E_8, E_7 \cdot \operatorname{Sp}(1))$  of rank 4 is characterized as a real 112 dimensional irreducible almost faithful representation of  $E_7 \times A_1$  owing to Section 2).

Conversely an o.t.g. induced from (8) or (9) is of coh 1 by Prof. 3.3(1) (4)  $(F=H, n_2=1, K=Sp(1))$ . An o.t.g. induced from (10) is of coh 2 by Prop. 3.3 (1) (4)  $(F=H, n_2=2, K=Sp(2))$ . An o.t.g. induced from (12) is of coh 3 by Prop. 3.3 (1) (4)  $(F=H, n_2=3, K=Sp(3))$ . An o.t.g. induced from (11) is of coh 2(cf. The linear isotropy representation of the symmetric pair  $(G_2, SO(4))$  of rank 2 is characterized as a real 8 dimensional irreducible almost faithful representation of  $A_1 \times A_1$  owing to Prop.'s 2.1, 2.2, 2.4). If  $(G, E^N)$  is induced from (13), then coh  $(G, E^N) = \cosh(A_1, pH(2)) \ge \cosh(A_1, pH(2)) = 3(cf. Prop. 3.3)$  and coh  $(G, E^N) \le \cosh(A_1, hH(2)) = \cosh(A_1, 0^r \oplus (4A_1)^r, R \oplus R^5) = 1 + \cosh(A_1, (4A_1)^r, R^5) = 3(cf. The linear isotropy representation of the symmetric pair <math>(SU(3), SO(3))$  of rank 2 is characterized as a real 5 dimensional irreducible representation of  $A_1$  owing to Prop.'s 2.1, 2.2, 2.4), where the action of  $A_1$  on pH(2) is given as Prop. 3.3 and Lemma 3.2. Q.E.D.

(III) Let  $(G, \mathbf{E}^N)$  be a real irreducible o.t.g. of type III.

PROPOSITION 4.3 coh  $(G, \mathbf{E}^N) \leq 3$  if and only if  $(\tilde{G}, \tilde{id}, \mathbf{R}^N)$  is equivalent as real representation to one of the followings:

 $\begin{array}{ll} \operatorname{coh} = 1: & \textit{none}, \\ \operatorname{coh} = 2: & (14) & (\mathbf{R} \times A_k \times A_1, \, \hat{t} & & \wedge 1, \, \hat{t} & & \wedge 1, \, \mathbf{C} & & \mathbf{C}^{k+1} & & \mathbf{C}^2); \, k \geq 1, \, t \in \mathbf{R}^{\times}. \\ \operatorname{coh} = 3: & (15) & (\mathbf{R} \times A_k \times A_2, \, \hat{t} & & \wedge 1, \, \mathbf{C} & & \mathbf{C}^{k+1} & & \mathbf{C}^3); \, k \geq 2, \, t \in \mathbf{R}^{\times}. \\ & & (16) & (\mathbf{R} \times C_k \times A_1, \, \hat{t} & & \wedge 1, \, \mathbf{C} & & \mathbf{C}^{2k} & & \mathbf{C}^2); \, k \geq 2, \, t \in \mathbf{R}^{\times}. \end{array}$ 

PROOF: Suppose coh  $(G, E^N) \le 3$ . Then  $n_2 \le 3$  (cf. Prop. 3.3(1)(4)).

Assume  $n_2=3$ . Then  $(\tilde{G}_2, \rho_2, C^{n_2})$  is equivalent as complex representation to  $(A_2, A_1, A_2, A_2)$  $C^3$ ) owing to Prop. 2.18, Remark 2.19 and coh  $(U(n_1) \times A_1, id \overset{\triangle}{\otimes} 2A_1, C^{n_1} \overset{\triangle}{\otimes} C^3) \ge \text{doh}(A_1, C^{n_2} \overset{\triangle}{\otimes} C^3)$ pC(3))=6. If  $\rho_1$  is 'real' and  $n_1 \ge 6$ , then  $coh(G, E^N) = coh(U(1) \times \tilde{G}_1 \times A_2, id \stackrel{\diamondsuit}{\otimes} \rho_1 \stackrel{\diamondsuit}{\otimes} A_1, C \stackrel{\diamondsuit}{\otimes} A_2)$  $C^{n_1} \underset{C}{\otimes} C^3$  = coh  $(\tilde{G}_1 \times (U(1) \times A_2), \rho_1^r \underset{R}{\hat{\otimes}} (id \underset{C}{\hat{\otimes}} \Lambda_1)_R, R^{n_1} \underset{R}{\otimes} (C \underset{C}{\otimes} C^3)_R) \ge \text{coh } (SO(n_1) \times U(3),$  $id_R$ ,  $R^{n_1} \otimes C_R^3 = \text{coh}(U(3), pR(6)) \ge \text{doh}(U(3), pR(6)) = 12(\text{cf. Prop. 3.3})$ . So  $(\tilde{G}_1, \rho_1, C^{n_1})$  is not 'real' or  $n_1 \le 5$ . Then  $(\tilde{G}, i\tilde{d}, \mathbb{R}^N)$  is equivalent as real representation to (15) owing to Lemma 3.6(1)(F = C, i = 1,  $m_1 = n_1$ ,  $n = n_2 = 3$ ),  $3 \ge \text{coh}(G, E^N) \ge d_1 + 3$ , Prop. 2.2( $\Lambda_2(k=3)$ ) is 'real' of degree 6), Remark 2.3, doh  $(\mathbf{R} \times A_k \times A_2, \hat{t} \overset{\diamond}{\underset{C}{\otimes}} 2\Lambda_1 \overset{\diamond}{\underset{C}{\otimes}} \Lambda_1, \mathbf{C} \overset{\diamond}{\underset{C}{\otimes}} \mathbf{C}^{(k+2)(k=1)/2} \overset{\diamond}{\underset{C}{\otimes}} \mathbf{C}^3)$  $=(k+1)(2k-1)-8 \ge 27(k \ge 4)$ , Prop. 2.6( $\Lambda_2(k=2)$  is 'real' of degree 11), doh  $(\mathbf{R} \times C_2 \times A_2, \hat{t} \hat{\otimes} \Lambda_1 \hat{\otimes} \Lambda_1, \mathbf{C} \hat{\otimes} \mathbf{C}^4 \hat{\otimes} \mathbf{C}^3) = 5$ , coh  $(\mathbf{R} \times C_k \times A_2, \hat{t} \hat{\otimes} \Lambda_1 \hat{\otimes} \Lambda_1, \mathbf{C} \hat{\otimes} \mathbf{C}^{2k} \hat{\otimes} \mathbf{C}^3) \ge \dim \mathbf{C}$  $\underset{C}{\otimes} C^{2k} \underset{C}{\otimes} C^3 - \dim \mathbb{R} \times C_k \times A_2 + \dim C_{k-3} = 6$  (cf. Assume  $n_2=2$ . Then  $(\tilde{G}_2, \rho_2, C^{n_2})$  is equivalent as complex representation to  $(A_1, A_1, C^2)$  by Prop. 2.18. If  $(\tilde{G}_1, \rho_1, C^{n_1})$  is 'real' of degree  $n_1 \ge 4$ , then  $\operatorname{coh}(G, E^N) = \operatorname{coh}(U(1) \times \tilde{G}_1 \times A_1, id \stackrel{\wedge}{\otimes} \rho_1 \stackrel{\wedge}{\otimes} A_1, C \stackrel{\wedge}{\otimes} C^{n_1} \stackrel{\wedge}{\otimes} C^2) = \operatorname{coh}(\tilde{G}_1 \times (U(1) \times A_1), \rho_1^r \stackrel{\wedge}{\otimes} (id \stackrel{\wedge}{\otimes} A_1)_R, R^{n_1} \stackrel{\wedge}{\otimes} (C \stackrel{\wedge}{\otimes} C^2)_R) \ge \operatorname{coh}(SO(n_1) \times U(2), id \stackrel{\wedge}{\otimes} id_R, R^{n_1} \stackrel{\wedge}{\otimes} C_R^2) = \operatorname{coh}(U(2), pR(4)) \ge \operatorname{doh}(U(2), pR(4)) = 6.$  So  $(\tilde{G}_1, C^{n_1})$  is not 'real' or  $n_1 \le 3$ . Then  $(\tilde{G}, id, R^N)$  is equivalent as real representation to (14) or (16) owing to Prop. 2.18, Lemma 3.6(2)( $F = C, i = 1, m_1 = n_1 > n = n_2 = 2$ ),  $3 \ge \operatorname{coh}(G, E^N)$   $\ge d_1 + 2$ , Prop. 2.2( $A_2(k=3)$  is 'real' of degree 6), Remark 2.3,  $\operatorname{doh}(R \times A_k \times A_1, \hat{t} \stackrel{\wedge}{\otimes} A_2 \stackrel{\wedge}{\otimes} C A_1, C \stackrel{\wedge}{\otimes} C^{k(k+1)} \stackrel{\wedge}{\otimes} C^2) = k^2 - 4 \ge 12(k \ge 4), \operatorname{doh}(R \times A_k \times A_1, \hat{t} \stackrel{\wedge}{\otimes} 2A_1 \stackrel{\wedge}{\otimes} A_1, C \stackrel{\wedge}{\otimes} C^{k(k+1)/2} \stackrel{\wedge}{\otimes} C^2) = k^2 - 4 \ge 12(k \ge 4), \operatorname{doh}(R \times A_k \times A_1, \hat{t} \stackrel{\wedge}{\otimes} 2A_1 \stackrel{\wedge}{\otimes} A_1, C \stackrel{\wedge}{\otimes} C^{k(k+1)/2} \stackrel{\wedge}{\otimes} C^2) = k^2 - 4 \ge 12(k \ge 4), \operatorname{doh}(R \times A_k \times A_1, \hat{t} \stackrel{\wedge}{\otimes} 2A_1 \stackrel{\wedge}{\otimes} A_1, C \stackrel{\wedge}{\otimes} C^{k(k+1)/2} \stackrel{\wedge}{\otimes} C^2) = k^2 - 4 \ge 12(k \ge 4), \operatorname{doh}(R \times A_k \times A_1, \hat{t} \stackrel{\wedge}{\otimes} 2A_1 \stackrel{\wedge}{\otimes} A_1, C \stackrel{\wedge}{\otimes} C^{k(k+1)/2} \stackrel{\wedge}{\otimes} C^2) = k^2 - 4 \ge 12(k \ge 4), \operatorname{doh}(R \times A_k \times A_1, \hat{t} \stackrel{\wedge}{\otimes} 2A_1 \stackrel{\wedge}{\otimes} A_1, C \stackrel{\wedge}{\otimes} C^{k(k+1)/2} \stackrel{\wedge}{\otimes} C^2) = k^2 - 4 \ge 12(k \ge 4), \operatorname{doh}(R \times A_k \times A_1, \hat{t} \stackrel{\wedge}{\otimes} 2A_1, C \stackrel{\wedge}{\otimes} C^{k(k+1)/2} \stackrel{\wedge}{\otimes} C^2) = k^2 - 4 \ge 12(k \ge 4), \operatorname{doh}(R \times A_k \times A_1, \hat{t} \stackrel{\wedge}{\otimes} 2A_1, C \stackrel{\wedge}{\otimes} C^{k(k+1)/2} \stackrel{\wedge}{\otimes} C^2) = k^2 - 4 \ge 12(k \ge 4), \operatorname{doh}(R \times A_k \times A_1, \hat{t} \stackrel{\wedge}{\otimes} 2A_1, C \stackrel{\wedge}{\otimes} C^2) = k^2 - 4 \ge 12(k \ge 4), \operatorname{doh}(R \times A_k \times A_1, \hat{t} \stackrel{\wedge}{\otimes} 2A_1, C \stackrel{\wedge}{\otimes} 2A$ 

of degree  $\geq 7$ ), doh  $(\mathbf{R} \times B_k \times A_1, \hat{t} \otimes A_k \otimes A_1, \mathbf{C} \otimes \mathbf{C}^{2^k} \otimes \mathbf{C}^2) = 2^{k+2} - k(2k+1) - k(2k+1)$ is  $4 \ge 7(k \ge 3)$ , Prop.  $2.12(\Lambda_1(k \ge 4)$  is 'real' of degree  $\ge 8$ ,  $\Lambda_i(k=4)$  for i=3,4 are 'real' of  $\operatorname{doh} (\boldsymbol{R} \times D_k \times A_1, \, \hat{t} \overset{\triangle}{\otimes}_{\boldsymbol{C}} A_i \overset{\triangle}{\otimes}_{\boldsymbol{C}} A_1, \, \boldsymbol{C} \overset{\triangle}{\otimes}_{\boldsymbol{C}} \boldsymbol{C}^{2^{k-1}} \overset{\triangle}{\otimes}_{\boldsymbol{C}} \boldsymbol{C}^2) = 2^{k+1} - k(2k-1) - 4 \geq 15$  $i=k-1, k \text{ (if } k \geq 5), \text{ Prop. 2.15, Remark 2.16, doh } (\mathbf{R} \times E_6 \times A_1, \hat{t} \stackrel{\diamondsuit}{\otimes} A_1 \stackrel{\diamondsuit}{\otimes} A_1, \mathbf{C} \stackrel{\diamondsuit}{\otimes} \mathbf{C}^{27} \stackrel{\diamondsuit}{\otimes} \mathbf{C}^2)$ =26, doh  $(\mathbf{R} \times E_7 \times A_1, \hat{t} \hat{\otimes} A_6 \hat{\otimes} A_1, \mathbf{C} \hat{\otimes} \mathbf{C}^{56} \hat{\otimes} \mathbf{C}^2) = 87.$ 

Conversely an o.t.g. induced from (14)(resp. (15)) is of coh 2(resp. 3)(cf. Prop. 3.3(1) (4)). If  $(G, \mathbf{E}^N)$  is induced from (16), then  $\operatorname{coh}(G, \mathbf{E}^N) = \operatorname{coh}(U(1) \times C_k \times A_1, id \hat{\otimes} A_1 \hat{\otimes} A_1, \mathbf{C}_1)$  $id\hat{\otimes}_{\mathbf{R}}(\Lambda_1\hat{\otimes}_{\mathbf{R}}\Lambda_1), \mathbf{R}^2\hat{\otimes}_{\mathbf{R}}(\mathbf{H}_{\bullet}^k\hat{\otimes}_{\mathbf{R}}\mathbf{H}) = \operatorname{coh}(C_k \times (SO(2) \times A_1), \Lambda_1\hat{\otimes}_{\mathbf{R}}(id\hat{\otimes}_{\mathbf{R}}\Lambda_1), \mathbf{H}^k\hat{\otimes}_{\mathbf{R}}(\mathbf{R}^2\hat{\otimes}_{\mathbf{R}}\mathbf{H})) = \operatorname{coh}(C_k \times (SO(2) \times A_1), \mathbf{H}^k\hat{\otimes}_{\mathbf{R}}\mathbf{H})$  $(SO(2) \times A_1, p\mathbf{H}(2)) = \cosh(SO(2), p\mathbf{R}(2)) + \cosh(A_1, (2A_1)^r, \mathbf{R}^3) = 2 + 1 = 3(\text{cf.} \text{ Prop. 3.3}).$ Q.E.D.

(IV) Let  $(G, \mathbf{E}^N)$  be a real irreducible o.t.g. of type IV.

PROPOSITION 4.4 coh  $(G, \mathbf{E}^N) \leq 3$  if and only if  $(\tilde{G}, \tilde{id}, \mathbf{R}^N)$  is equivalent as real represention to one of the followings:

coh = 1: none,

$$coh = 2: (17) \quad (A_k \times A_1, \Lambda_1 \stackrel{\triangle}{\otimes} \Lambda_1, C^{k+1} \stackrel{\triangle}{\otimes} C^2); k \ge 2,$$

$$\begin{array}{lll} \cosh=2: & (17) & (A_k\times A_1,\, \Lambda_1 \overset{\diamondsuit}{\underset{C}{\otimes}} \Lambda_1,\, C^{k+1} \overset{\smile}{\underset{C}{\otimes}} C^2);\, k \geq 2, \\ \cosh=3: & (18) & (A_k\times A_2,\, \Lambda_1 \overset{\diamondsuit}{\underset{C}{\otimes}} \Lambda_1,\, C^{k+1} \overset{\smile}{\underset{C}{\otimes}} C^3);\, k \geq 3. \end{array}$$

PROOF: Suppose coh  $(G, \mathbf{E}^N) \leq 3$ . Then  $(\tilde{G}, i\tilde{d}, \mathbf{R}^N)$  is equivalent as real representation to (17) or (18) owing to Prop. 4.3. In fact,  $(C_k \times A_1, A_1 \overset{\diamond}{\otimes} A_1, C^{2k} \overset{\diamond}{\otimes} C^2)(k \ge 2)$  and  $(A_1 \times A_1, \Lambda_1 \stackrel{\diamond}{\otimes} \Lambda_1, C^2 \stackrel{\diamond}{\otimes} C^2)$  are 'real', so they are not real irreducible, and coh  $(A_2 \times A_2, \Lambda_1 \stackrel{\diamond}{\otimes} C^2)$  $\Lambda_1$ ,  $C^3 \otimes C^3 = 4$  since  $(U(1) \times A_2 \times A_2$ ,  $id \otimes \Lambda_1 \otimes \Lambda_1$ ,  $C \otimes C^3 \otimes C^3$  is equivalent to the linear isotropy representation of the Hermitian symmetric pair (SU(6),  $S(U(3) \times U(3))$ ) of rank 3 whose restricted root system is of type C(cf. Tasaki-Yasukura[22], Helgason[7]).

Conversely an o.t.g. induced from (17)(resp. (18)) is of coh 2(resp. 3) since (U(1)) $\times A_k \times A_1$ ,  $id \stackrel{\diamond}{\otimes} A_1 \stackrel{\diamond}{\otimes} A_1$ ,  $C \stackrel{\diamond}{\otimes} C^{k+1} \stackrel{\diamond}{\otimes} C^2$ ) of  $k \ge 2$  (resp.  $(U(1) \times A_k \times A_2, id \stackrel{\diamond}{\otimes} A_1 \stackrel{\diamond}{\otimes} A_1, C \stackrel{\diamond}{\otimes} C^{k+1} \stackrel{\diamond}{\otimes} C^2)$  $C^3$ ) of  $h \ge 3$ ) is equivalent to the linear isotropy representation of the Hermitian symmetric pair  $(SU(k+3), S(U(k+1) \times U(2)))$  of rank 2(resp.  $(SU(k+4), S(U(k+1) \times U(3)))$  of rank 3) whose restricted root system is of type BC(cf. [22], [7]). Q.E.D.

(V) Let  $(G, \mathbf{E}^N)$  be a real irreducible o.t.g. of type V.

PROPOSITION 4.5 coh  $(G, E^N) \leq 3$  if and only if  $(\tilde{G}, i\tilde{d}, R^N)$  is equivalent as real representation to one of the followings:

$$coh = 1$$
: (19)  $(A_1, (2\Lambda_1)^r, \mathbf{R}^3)$ , (20)  $(A_3, \Lambda_2^r, \mathbf{R}^6)$ ,

(21) 
$$(C_2, \Lambda_2^r, \mathbf{R}^5)$$
, (22)  $(B_k, \Lambda_1^r, \mathbf{R}^{2k+1})$ ;  $k \ge 3$ ,

$$(23) \quad (D_{k}, \Lambda_{1}^{r}, \mathbf{R}^{2k}); \ k \ge 4, \qquad (24) \quad (D_{4}, \Lambda_{1}^{r}, \mathbf{R}^{8}); \ i = 3, 4,$$

$$(25) \quad (B_{3}, \Lambda_{3}^{r}, \mathbf{R}^{8}) \qquad (26) \quad (B_{4}, \Lambda_{4}^{r}, \mathbf{R}^{16}),$$

$$(27) \quad (G_{2}, \Lambda_{2}^{r}, \mathbf{R}^{7}), \qquad (29) \quad (A_{1}, (4\Lambda_{1})^{r}, \mathbf{R}^{5}),$$

$$(30) \quad (C_{3}, \Lambda_{2}^{r}, \mathbf{R}^{14}), \qquad (31) \quad (C_{2}, (2\Lambda_{1})^{r}, \mathbf{R}^{10}),$$

$$(32) \quad (G_{2}, \Lambda_{1}^{r}, \mathbf{R}^{14}), \qquad (33) \quad (F_{4}, \Lambda_{4}^{r}, \mathbf{R}^{26}),$$

$$(29) \quad (A_{1}, (4\Lambda_{1})^{r}, \mathbf{R}^{5}), \qquad (31) \quad (C_{2}, (2\Lambda_{1})^{r}, \mathbf{R}^{10}),$$

$$(53) \quad (\mathbf{R} \times B_{4}, \hat{t} \bigotimes_{C} \Lambda_{4}, \mathbf{C} \bigotimes_{C} \mathbf{C}^{16}); \ t \in \mathbf{R}^{\times},$$

$$(54) \quad (\mathbf{R} \times E_{6}, \hat{t} \bigotimes_{C} \Lambda_{1}, \mathbf{C} \bigotimes_{C} \mathbf{C}^{27}); \ t \in \mathbf{R}^{\times}.$$

PROOF: Suppose  $coh(G, E^N) \le 3$ . Then  $(G, id, R^N)$  is equivalent as real representation to one of  $(38) \sim (54)$  owing to Lemma 3.6(1)(F = C, i = 1, n = 1), Prop. 2.2, Remark 2.3,  $coh(U(1) \times A_k, id \stackrel{?}{\otimes} \Lambda_2, C \stackrel{?}{\otimes} C^{(k+1)k}) = [(k+1)/2]$  (cf.  $(U(1) \times A_k, id \stackrel{?}{\otimes} \Lambda_2, C \stackrel{?}{\otimes} C^{(k+1)k})$  is equivalent to the linear isotropy representation of the symmetric pair (SO(2k+2), U(k+1)) of rank [(k+1)/2],  $[(k+1)/2] \ge 4(k \ge 7)$ , Prop. 2.6, Prop. 2.9, Prop. 2.12, Remark 2.13,  $coh(U(1) \times D_6, id \stackrel{?}{\otimes} \Lambda_6, C \stackrel{?}{\otimes} C^{32}) \ge 4(cf. (U(1) \times D_6, id \stackrel{?}{\otimes} \Lambda_6, C \stackrel{?}{\otimes} C^{32})$  is contained in the linear isotropy representation of the symmetric pair  $(E_7, Sp(1) \cdot Spin(12))$  of rank 4), Prop. 2.15, Prop. 2.16,  $coh(U(1) \times F_4, id \stackrel{?}{\otimes} \Lambda_4, C \stackrel{?}{\otimes} C^{26}) \ge 7(cf.$  Each isotropy subgroup contains a group which is isomorphic to  $SU(3) \subset G_2 \subset Spin(7) \subset Spin(8) \subset F_4$  by Yokota[24, Prop.'s 5.45, 5.48, Thm's 5.33, 5.27, 5.2]),  $coh(U(1) \times E_7, id \stackrel{?}{\otimes} \Lambda_6, C \stackrel{?}{\otimes} C^{56}) \ge 4(cf. (U(1) \times E_7, id \stackrel{?}{\otimes} \Lambda_6, C \stackrel{?}{\otimes} C^{56})$  is contained in the linear isotropy representation of the symmetric pair  $(E_8, Sp(1) \cdot E_7)$  of rank 4),  $choh(U(1) \times G_2, id \stackrel{?}{\otimes} \Lambda_1, C \stackrel{?}{\otimes} C^{14}) = 13$ ,  $choh(U(1) \times F_4, id \stackrel{?}{\otimes} \Lambda_1, C \stackrel{?}{\otimes} C^{52}) = 51$ ,  $choh(U(1) \times E_6, id \stackrel{?}{\otimes} \Lambda_6, C \stackrel{?}{\otimes} C^{78}) = 77$ ,  $choh(U(1) \times E_7, id \stackrel{?}{\otimes} \Lambda_1, C \stackrel{?}{\otimes} C^{133}) = 132$ ,  $choh(U(1) \times E_8, id \stackrel{?}{\otimes} \Lambda_7, C \stackrel{?}{\otimes} C^{248}) = 247$ .

Conversely  $\cosh(38) = \cosh(39) = 1$  since SU(k+1) and Sp(k) are transitive on hyperspheres in the representation spaces. (40)  $\sim$  (45) are equivalent to  $(SO(2) \times SO(n), id \otimes id, R^2 \otimes R^n)$  for some  $n \neq 4$  of  $\cosh 2$ . The o.t.g. induced from (46) is equivalent to  $O(SO(2) \times G_2, id \otimes_R \Lambda_2^r, R^2 \otimes_R R^7)$  and the isotropy subgroup at  $\begin{pmatrix} \alpha \\ \beta \end{pmatrix}$  in  $R(2,7) \simeq R^2 \otimes_R R^7$  ( $\alpha > \beta > 0$ ) is isomorphic to SU(2) by Yokota [24, Example 5.1], so  $\cosh(46) = 2$  (cf. Prop. 3.3(1)(4)). The o.t.g. induced from (48) is equivalent to the linear isotropy representation of the symmetric pair  $(E_6, U(1) \cdot \text{Spin}(10))$  of rank 2 by Prop. 2.12 and Remark 2.13 since it is characterized by its degree up to equivalence. Since [(k+1)/2] = 2 for k=4,  $\cosh(49) = 2$ . The o.t.g. induced from (50) is equivalent to the linear isotropy representation of the symmetric pair (Sp(3), U(3)) of rank 3 by Prop. 2.2 and Remark 2.3. Since

[(k+1)/2]=3 for k=5 or 6, coh (51)= coh (52)=3. The o.t.g. induced from (53) is equivalent to  $O(SO(2)\times Spin(9), id \underset{R}{\hat{\otimes}} \Lambda_4^r$ ,  $R^2\underset{R}{\otimes} R^{16}$ ). Any element of  $R(2, 16) \simeq R^2\underset{R}{\otimes} R^{16}$  to the form  $\begin{pmatrix} \alpha & 0 & 0 & \cdots & 0 & 0 & 0 & 0 & \cdots & 0 \\ 0 & \beta & 0 & \cdots & 0 & \gamma & \delta & \delta & 0 & \cdots & 0 \end{pmatrix}$ , and the isotropy subgroup is isomorphic to SU(3) if  $\alpha^2 \neq \beta^2 + \gamma^2 + \delta^2 + \varepsilon^2$  owing to the use of the mapping f in Lemma 3.2 and Yokota [24, Theorems 5.51, 5.27, 5.2]. So coh (53)=3. The o.t.g. induced from (54) is equivalent to the linear isotropy representation of the symmetric pair  $(E_7, U(1) \cdot E_6)$  of rank 3 by Prop. 2.15 and Remark 2.16. So coh (54)=3. Q.E.D.

(VII) Let  $(G, E^N)$  be a real irreducible o.t.g. of type VII.

PROPOSITION 4.7 coh  $(G, \mathbf{E}^N) \leq 3$  if and only if  $(\tilde{G}, \tilde{id}, \mathbf{R}^N)$  is equivalent as real representation to one of the followings:

```
coh=1: (55) (A_k, \Lambda_1, C^{k+1}); k \ge 1,

(56) (C_k, \Lambda_1, C^{2k}); k \ge 2,

coh=2: (57) (D_5, \Lambda_5, C^{16}),

(58) (A_4, \Lambda_2, C^{10}),

coh=3: (59) (A_6, \Lambda_2, C^{21}).
```

PROOF: Suppose coh  $(G, \mathbf{E}^N) \leq 3$ . Then  $(\tilde{G}, \tilde{id}, \mathbf{R}^N)$  is equivalent as real representation to  $(55) \sim (58)$  or (59) by Prop. 4.6. In fact,  $(B_k, \Lambda_1, C^{2k+1})$ ,  $(D_k, \Lambda_1, C^{2k})$ ,  $(A_1, 2\Lambda_1, C^3)$ ,  $(A_3, \Lambda_2, C^6)$ ,  $(C_2, \Lambda_2, C^5)$ ,  $(G_2, \Lambda_2, C^7)$ ,  $(B_3, \Lambda_3, C^8)$ ,  $(B_4, \Lambda_4, C^{16})$  are 'real' and not real irreducible, so they are not of type VII, and coh  $(A_2, 2\Lambda_1, C^6) = \cosh(A_5, \Lambda_2, C^{15}) = \cosh(E_6, \Lambda_1, C^{27}) = 4$  since the restricted root systems of (Sp(3), U(3)), (SO(12), U(6)),  $(E_7, U(1) \cdot E_6)$  are of type BC (cf. [7], [22]).

Conversely coh (55)=coh (56)=1 is evident. O.t.g.'s induced from (57), (58) are of coh 2 since the restricted root systems of  $(E_6, U(1) \cdot Spin(10))$  and (SO(10), U(5)) are of type BC. The o.t.g. induced from (59) is of coh 3 since the restricted root system of (SO(14), U(7)) is of type BC (cf. [7] and [22]). Q.E.D.

Now we have the following result.

THEOREM 4.8 Let  $(G, \mathbf{E}^N)$  be an o.t.g. such that the identity representation id:  $G \rightarrow SO(N)$  is real irreducible. Then coh  $(G, \mathbf{E}^N) \leq 3$  if and only if  $(\tilde{G}, i\tilde{d}, \mathbf{R}^N)$  is equivalent as real representation to one of the followings:

```
coh=1: (IX), (VIII), (8), (9), (19), (20), (21), (22), (23), (24), (25), (26), (27), (38), (39), (55), (56). coh=2: (10), (11), (14), (17), (28), (29), (30), (31), (32), (33), (40), (41), (42), (43), (44), (45), (46), (47), (48), (49), (57), (58).
```

```
coh = 3: (3.7), (1), (2), (3), (4), (5), (6), (7), (12), (13),
         (15), (16), (18), (34), (35), (36), (37), (50), (51),
         (52), (53), (54), (59).
```

PROOF: Unifying (3.7) of Theorem 3.5, Propositions 4.1~4.7 and type VIII, IX in Section 3, we have the result. Q.E.D.

REMARK 4.9 O.t.g.'s induced from (25), (26), (27), (39), (55), (56), (17), (46), (47), (57), (58), (6), (18), or (59) are not maximal. O.t.g.'s induced from (13), (16), or (53) are not obtained from the linear isotropy representations of any Riemannian symmetric pairs. Others are equivalent to the linear isotropy representations of some Riemannian symmetric pairs of rank at most 3 if they are maximal. (26) is obtained from the linear isotropy representation of  $(F_4, Spin(9))$ . The o.t.g. induced from (24) (resp. (42), (7)) is equivalent to one from (23)(resp. (41), (5)) of k=4.

REMARK 4.10 O.t.g.'s induced from (13) or (16) are missed in the Theorem 7 of Hsiang-Lawson [11] if k and 3 are relatively prime and  $k \ge 4$ , since the dimension of the representation spaces of (13) or (16) is 8k and the others of cohomogeneity 3 are of dimension 3m for some integer m except (53) of dimension 16.
