

## A CONSTRUCTION OF INNER MAPS PRESERVING THE HAAR MEASURE ON SPHERES

BOGUSLAW TOMASZEWSKI

**We show, for  $n \geq m$ , the existence of non-trivial inner maps  $f: B^n \rightarrow B^m$  with boundary values  $f_*: S^n \rightarrow S^m$  such that  $f_*^{-1}(A)$  has a positive Haar measure for every Borel subset  $A$  of  $S^m$  which has a positive Haar measure. Moreover, if  $n = m$ , the equality  $\sigma(f_*^{-1}(A)) = \sigma(A)$  holds, where  $\sigma$  is the Haar measure of  $S^m$ .**

In this paper  $\mathbf{C}^n$  is an  $n$ -dimensional complex space with inner product defined by  $\langle z^1, z^2 \rangle = \sum z_i^1 \bar{z}_i^2$ , where  $z^j = (z_1^j, z_2^j, \dots, z_n^j)$  for  $j = 1, 2$ , and the norm  $|z| = \langle z, z \rangle^{1/2}$ . Let us introduce some notation:

$$B^n = \{z \in \mathbf{C}^n : |z| < 1\}, \quad S^n = \partial B^n;$$

let  $d$  be the metric on  $S^n$ :

$$d(z, z^*) = (1 - \operatorname{Re}\langle z, z^* \rangle)^{1/2} = \frac{1}{\sqrt{2}} |z - z^*| \quad \text{for } z, z^* \in S^n,$$

and finally

$$B(z, r) = \{z^* \in S^n : d(z, z^*) < r\} \quad \text{for } z \in S^n \text{ and } r > 0.$$

For every complex function  $h: X \rightarrow \mathbf{C}$  we define  $Z(h) = h^{-1}(0)$ . A holomorphic map  $f: B^n \rightarrow B^m$  is called inner if

$$f_*(z) = \lim_{r \rightarrow 1} f(rz) \in S^m \quad \text{for almost every } z \in S^n$$

with respect to the unique, rotation-invariant Borel measure  $\sigma_n$  on  $S^n$  such that  $\sigma_n(S^n) = 1$ . If a continuous function  $g: \bar{B}^n \rightarrow \mathbf{C}^m$ , defined on the closure of  $B^n$ , is holomorphic on  $B^n$ , we write  $g \in A_m(B^n)$  or  $g \in A(B^n)$  when  $m = 1$ . The theorem stated below is a generalization of the result of Aleksandrov [1]. Corollary 1 answers the problem given by Rudin [3]. Corollary 4 is a result of Aleksandrov obtained independently by the author.

**THEOREM.** *Let  $n \geq m$  and let  $g = (g_1, \dots, g_m) \in A_m(B^n)$ ,  $h \in A(B^n)$  be maps such that  $|g(z)| + |h(z)| \leq 1$  and  $h(z) \neq 0$  for some  $z \in B^n$ . Then there exists an inner map  $f = (f_1, f_2, \dots, f_m): B^n \rightarrow B^m$  such that  $f(z) = g(z)$  for every  $z \in Z(h)$  and  $f_i(z) = g_i(z)$  for every  $z \in B^n$  and  $i = 1, 2, \dots, m - 1$ .*

**COROLLARY 1.** *For every  $n \geq m$  there exist inner maps  $f: B^n \rightarrow B^m$  such that for every Borel subset  $A \subset S^m$  the inequality  $\sigma_n(f_*^{-1}(A)) > 0$  holds provided  $\sigma_m(A) > 0$ . Moreover, if  $m = n$ , the equality  $\sigma_n(f_*^{-1}(A)) = \sigma_n(A)$  holds and  $f$  is not an automorphism of  $B^n$ .*

**COROLLARY 2.** *For every  $n \geq 1$  there exist inner maps  $f: B^n \rightarrow B^m$ , not automorphisms of  $B^n$ , such that*

$$\int_{S^n} (h \circ f_*) d\sigma_n = \int_{S^n} h d\sigma_n$$

for every continuous function  $h$  on  $S^n$ .

Corollary 2 is an immediate consequence of Corollary 1. Let us assume that  $n \geq m$  and  $n \geq 2$ . To deduce the assertion of Corollary 1 from the Theorem let us take a holomorphic function  $k \in A(B^1)$  and the map  $g \in A_m(B^n)$ ,  $g(z) = p(z) + \frac{1}{4}z_n^2 r(z_n)$ , where  $p(z) = (z_1, z_2, \dots, z_{m-1}, 0)$ ,  $r(z) = (0, \dots, 0, k(z_n))$  for  $z \in B^n$ . Define  $h(z) = \frac{1}{4}z_1 z_n^2$ . Then

$$|g(z)| + |h(z)| \leq |p(z)| + \frac{1}{4}|z_n^2| + \frac{1}{4}|z_n^2| \leq \sqrt{1 - z_n^2} + \frac{1}{2}|z_n^2| \leq 1.$$

By virtue of the Theorem there exists an inner map  $f = (f_1, f_2, \dots, f_m): B^n \rightarrow B^m$  such that

$$(1) \quad f_j(z_1, z_2, \dots, z_n) = z_j \quad \text{for } j = 1, 2, \dots, m-1,$$

$$(2) \quad f_m(0, 0, \dots, 0, z_n) = \frac{1}{4}z_n^2 r(z_n),$$

$$(3) \quad f(z_1, z_2, \dots, z_{n-1}, 0) = (z_1, z_2, \dots, z_{m-1}, 0).$$

For any  $z \in B^{m-1}$  and  $l \geq m$  let

$$B_z^l = \{z^* \in B^l: z_j^* = z_j \text{ for } j = 1, 2, \dots, m-1\},$$

$$S_z^l = \{z^* \in S^l: z_j^* = z_j \text{ for } j = 1, 2, \dots, m-1\},$$

let  $\sigma_z^l$  be the rotation-invariant measure on the sphere  $S_z^l$  such that  $\sigma_z^l(S_z^l) = 1$  and let  $f_z, f_z^*$  be the restrictions of  $f, f_*$  to the sets  $B_z^n$  and  $S_z^n$  respectively. From (1) it follows that  $f_z: B_z^n \rightarrow B_z^m$  and (2) says that  $f_z(w_1) = w_2$ , where  $w_1, w_2$  are the centers of the balls  $B_z^n, B_z^m$  respectively. Since  $B_z^m$  is a one-dimensional complex ball, the equality  $\sigma_z^n((f_z^*)^{-1}(C)) = \sigma_z^m(C)$  holds for every Borel subset  $C$  of  $S_z^m$  and every  $z$  for which  $f_z$  is an inner map (see [4] p. 405). The function  $f_z$  is inner for almost every  $z \in B^{m-1}$  (with respect to the usual Lebesgue measure  $\lambda$  on  $B^{m-1}$ ) because the map  $f$  is inner. Let us notice that there are positive functions

$s_1, s_2: B^{m-1} \rightarrow R_+$  such that for all Borel subsets  $C^1 \subset S^n, C^2 \subset S^m$  we have

$$\begin{aligned} \sigma_n(C^1) &= \int_{B^{m-1}} s_1(z) \cdot \sigma_z^1(C_z^1) d\lambda(z), \\ \sigma_m(C_2) &= \int_{B^{m-1}} s_2(z) \cdot \sigma_z^m(C_z^2) d\lambda(z), \end{aligned}$$

where  $C_z^1 = C^1 \cap S^n, C_z^2 = C^2 \cap S^m$ . Substituting  $C_1 = (f^*)^{-1}(C_2)$  and using the equality  $\sigma_z^n(C_z^1) = \sigma_z^m(C_z^2)$  (which holds for almost every  $z$ ), it is easy to see that both of the above integrals are positive or equal to 0. If  $n = m$  then  $s_1 = s_2$  and the equality holds. This ends the proof of Corollary 1.

The following proof of the assertion of the Theorem is based on Löw's construction of inner functions [3]. Let  $g$  and  $h$  be maps satisfying the assumptions of the Theorem. Then  $\sigma_n(F) = 0$ , where  $F = Z(h) \cap S^n$ . (This fact can be proved by induction. For  $n = 1$  it is well-known theorem.) For  $\delta > 0$  let

$$F_\delta = \{z \in S^n : d(z, F) < \delta\} \quad \text{and} \quad \|s\|_\delta = \sup_{z \in F_\delta} |s(z)|,$$

where  $s: S^n \rightarrow C^m$  is a continuous map. Observe that there exist constants  $A_1, A_2$  such that for every  $0 < r < \sqrt{2}$ ,

$$(4) \quad A_1 r^{2n-1} \leq A(r) \leq A_2 r^{2n-1},$$

where  $A(r) = \sigma_n(B(z, r))$  for any  $z \in S^n$ .

Let  $S \subset S^n$  be any closed subset of  $S^n, \sigma_n(S) > 0$ . Assume that for some number  $r > 0$ ,

$$(5) \quad \sigma_n(S_r) \leq 2\sigma_n(S),$$

where  $S_r = \{z \in S^n : d(z, S) < r\}$ . Let  $\{B(z^j, r)\}_{j=1}^{N(r)}$  be a maximal family of disjoint balls with centers  $z^j \in S$ . Since  $S_r \supset \bigcup_{j=1}^{N(r)} B(z^j, r)$  and  $S \subset \bigcup_{j=1}^{N(r)} B(z^j, 2r)$ , applying inequalities (4) and (5), we get

$$\begin{aligned} 2\sigma_n(S) &\geq \sigma_n(S_r) \geq \sigma_n\left(\bigcup_{j=1}^{N(r)} B(z^j, r)\right) = \sum_{j=1}^{N(r)} \sigma_n(B(z^j, r)) \\ &= N(r) \cdot A(r) \geq A_1 r^{2n-1} \cdot N(r) \end{aligned}$$

and

$$\begin{aligned}\sigma_n(S) &\leq \sigma_n\left(\bigcup_{j=1}^{N(r)} B(z^j, 2r)\right) = \sum_{j=1}^{N(r)} A(2r) = N(r) \cdot A(2r) \\ &\leq N(r) \cdot A_2 \cdot (2r)^{2n-1} = N(r) \cdot A_2 \cdot 2^{2n-1} \cdot r^{2n-1}.\end{aligned}$$

So we have proved the existence of positive constants  $C_1$  and  $C_2$  ( $C_1 = 1/2^{2n-1}$ ,  $C_2 = 2/A_1$ ) such that

$$(6) \quad \frac{C_1}{r^{2n-1}} \cdot \sigma_n(S) \leq N(r) \leq \frac{C_2}{r^{2n-1}} \cdot \sigma_n(S).$$

Let us assume now that  $r > 0$ ,  $z \in B^n$ ,  $k$  is a natural number and  $M_k$  is the maximal number of disjoint balls of radius  $r$  and with centers in  $B(z, (k+1)r)$ . Because these balls are included in  $B(z, (k+2)r)$ , an argument similar to the above gives the estimate

$$(7) \quad M_k \leq C_3 k^{2n-1}$$

for some constant  $C_3$ . Let  $\varphi: (0, 1) \rightarrow R$  be the continuous, positive function defined by

$$\varphi(a) = \frac{1}{4\pi} \cdot C_1 \cdot A_1 \cdot \arccos(a) \cdot \left[\log \frac{1}{a}\right]^{(2n-1)/2}.$$

**LEMMA 1.** *Let  $0 < 2\varepsilon < a < b$ ,  $0 < \delta < 2C_3 \cdot a$ ,  $\varepsilon < C_3 e^{-2n}$ ,  $R < 1$ . Let  $P$  be a closed subset of  $F_\delta$  and let  $v$  be a continuous map  $v: S^n \rightarrow \mathbf{C}^m$  such that  $|v(z)| > a$  for  $z \in P$ . There exists a closed subset  $K$  of  $F_\delta$  and a holomorphic map  $u: \mathbf{C}^n \rightarrow \mathbf{C}^m$  such that:*

- (a)  $\|v + h \cdot u\|_{\delta/2} \leq \max(1, \|f\|_{\delta/2}) + 3\varepsilon;$
- (b)  $\|u\|_R = \sup_{|z| \leq R} |u(z)| \leq \varepsilon;$
- (c)  $|v(z) + h(z) \cdot u(z)| > a - 3\varepsilon$  for  $z \in K \cup P;$
- (d)  $K \subset F_\delta$ ,  $K \cap P = \emptyset$  and  
 $\sigma_n(K) \geq \varphi(a) \cdot [\log(4C_3/\delta\varepsilon)]^{-(2n-1)/2} \cdot \sigma_n(F_\delta - P);$
- (e)  $|g(z)| < \varepsilon$  for  $z \in B^n - F_{\delta/2};$
- (f)  $u_j \equiv 0$  for  $j = 1, 2, \dots, m-1$ , where  $u = (u_1, u_2, \dots, u_m).$

*Proof.* If  $\sigma_n(P) = \sigma_n(F_\delta)$  then the map  $u = (0, 0, \dots, 0)$  and the set  $K = \emptyset$  satisfy conditions (a)–(e). Let us assume that  $\sigma_n(P) < \sigma_n(F_\delta)$ .

There exists a positive number  $\gamma$  such that  $\gamma < \delta/2$  and

$$(8) \quad \sigma_n(S) \geq \frac{1}{2} \cdot \sigma_n(F_\delta - P),$$

where  $S = S^n - [(S^n - F_\delta) \cup P]_\gamma$ .

Since  $v, h$  are uniformly continuous maps and  $S$  is a closed subset, there exists a positive number  $\gamma^*$  such that

$$(9) \quad |g(z) - g(z')| < \varepsilon\delta, \quad |v(z) - v(z')| < \varepsilon, \quad \sigma_n(S_r) \leq 2 \cdot \sigma_n(S)$$

for  $z, z' \in S^n, d(z, z') < \gamma^*$  and  $r < \gamma^*$ .

Let  $r, m$  be positive numbers such that  $r \leq \frac{1}{2} \min(\gamma, \gamma^*)$ ,  $m$  is an integer and  $mr^2 = \log(2C_3/\delta\varepsilon)$ . Moreover we assume  $m$  is large so that

$$(10) \quad C_2 \cdot m^{(2n-1)/2} \cdot e^{-m(1-R)} < \varepsilon.$$

Choose a maximal family  $\{B(z^j, r)\}_{j=1}^{N(r)}$  of pairwise disjoint balls with centers  $z^j \in S^n$ . Because of (9), condition (5) is satisfied, so inequalities (6) also hold. For  $k = 1, 2, \dots, [\sqrt{2}/r]$  and  $z \in S^n$  let

$$V_k(z) = \{z^j : kr \leq d(z, z^j) < (k+1)r\}$$

and let  $N_k(z)$  be the number of elements of the set  $V_k$ . Since  $V_k(z) \subset B(z, (k+1)r)$ , from the definition of  $M_k$ , we have  $N_k(z) \leq M_k$  and (7) gives us

$$(11) \quad N_k(z) \leq C_3 k^{2n-1}.$$

Let  $g(z) = \sum_{j=1}^{N(r)} \beta_j e^{-m(1-\langle z, z^j \rangle)}$ , where  $\beta_j = (0, 0, \dots, 0, \alpha_j) \in \mathbf{C}^m$  is defined by  $\beta_j = (0, 0, \dots, 0, 0)$  if  $|f(z^j)| \geq b$ . If  $|f(z^j)| < b$ , then let  $\beta_j$  be of the previous form, such that

$$|f(z^j) + h(z) \cdot \beta_j| = b \quad \text{and} \quad |f(z^j) + \alpha \cdot h(z) \cdot \beta_j| \leq b$$

for every  $\alpha \in \mathbf{C}, |\alpha| = 1$ . Let us notice that for every  $j, |\beta_j| \leq 1/|h(z^j)| \leq 1/\delta$  and that

$$\begin{aligned} g(z) &= \vec{k} \cdot \sum_{j=1}^{N(r)} |\beta_j| \cdot e^{-md^2(z, z^j)} \cdot e^{iQ_{m,j}(z)} \\ &= \vec{k} \cdot \sum_{k=0}^{[\sqrt{2}/r]} \sum_{z^j \in V_k(z)} |\beta_j| e^{-md^2(z, z^j)} e^{iQ_{m,j}(z)} \end{aligned}$$

for some real functions  $Q_{m,j}$  and  $\vec{k} = (0, 0, \dots, 0, 1) \in \mathbf{C}^m$ .

If  $V_0(z) = \emptyset$  or  $z \in B(z^j, r)$  with  $\beta_j = 0$  then, because of (11) and the inequality  $mr^2 > 2n$ , we have

$$(12) \quad |g(z)| \leq \sum_{k=1}^{[\sqrt{2}/r]} \sum_{z' \in V_k(z)} \frac{1}{\delta} e^{-md^2(z, z')} \sum_{k=1}^{[\sqrt{2}/r]} \frac{1}{\delta} |V_k(z)| e^{-mk^2r^2} \\ \leq \sum_{k=1}^{\infty} \frac{C_3}{\delta} k^{2n-1} e^{-k^2mr^2} \leq \frac{C_3}{\delta} \sum_{k=1}^{\infty} e^{-kmr^2} \leq 2 \frac{C_3}{\delta} e^{-mr^2} = \varepsilon.$$

This proves part (e) of Lemma 1. If  $z \in B(z^j, r)$  with  $\beta_j \neq 0$  then

$$(13) \quad |v(z) + h(z) \cdot u(z)| \\ \leq \left| v(z^j) + h(z^j) \cdot \beta_j \cdot e^{-md^2(z, z')} \cdot e^{iQ_{m,j}(z)} \right| \\ + \left| [h(z) - h(z^j)] \cdot \beta_j \cdot e^{-md^2(z, z')} \cdot e^{iQ_{m,j}(z)} \right| + |v(z) - v(z^j)| \\ + \left| h(z) \cdot \sum_{z' \notin V_0(z)} \beta_j \cdot e^{-md^2(z, z')} \cdot e^{iQ_{m,m}(z)} \right| \\ = \text{I} + \text{II} + \text{III} + \text{IV}.$$

Because of (9)

$$\text{III} \leq \varepsilon \quad \text{and} \quad \text{II} \leq |h(z) - h(z^j)| \cdot |\beta_j| < \delta \cdot \varepsilon \cdot \frac{1}{\delta} = \varepsilon.$$

By the same argument as in (12) we can prove that  $\text{IV} \leq \varepsilon$ . Moreover, we have  $\text{I} \leq |v(z^j)| + |h(z^j) \cdot \beta_j| = b$ . This altogether gives us

$$(14) \quad |v(z) + h(z) \cdot u(z)| \leq b + 3\varepsilon.$$

Inequalities (12) and (14) prove part (a) of Lemma 1. Now we shall determine a certain subset  $V$  of  $W = \bigcup_{j=1}^{N(r)} B(z^j, r)$ . To do this let us fix  $j$ ,  $1 \leq j \leq N(r)$ , and let us take  $\alpha = |v(z_j)|$ ,  $s(z) = e^{-md^2(z, z')}$ ,  $Q(z) = \arg(e^{-m(1-\langle z, z' \rangle)}) = m \cdot \text{Im} \langle z, z^j \rangle$ .

Let us assume at first that  $\alpha < 1$ . We define

$$V_j = \{z \in B(z^j, r) : s(z) \geq a \text{ and } \cos Q(z) \geq a\}.$$

Using the same notation as in (13) we can write

$$(15) \quad |v(z) + h(z) \cdot u(z)| \geq \text{I} - \text{II} - \text{III} - \text{IV}.$$

As before,  $\text{II} \leq \varepsilon$ ,  $\text{III} \leq \varepsilon$  and  $\text{IV} \leq \varepsilon$ . Assuming  $z \in V_j$ , we have

$$\begin{aligned}
 (16) \quad \text{I} &= \left| v(z^j) + h(z^j) \cdot \beta_j \cdot e^{-m \cdot d^2(z, z^j)} \cdot e^{iQ(z)} \right| \\
 &\geq |\alpha + (1 - \alpha) \cdot s(z) \cdot e^{iQ(z)}| \\
 &= \sqrt{\alpha^2 + 2\alpha(1 - \alpha) \cdot s(z) \cdot \cos Q(z) + (1 - \alpha)^2} \geq a
 \end{aligned}$$

because of our assumption about  $s(z)$  and  $\cos Q(z)$ , the definition of  $\beta_j$  and simple geometry.

Combining (15) and (16) we get

$$(17) \quad |v(z) + h(z) \cdot u(z)| > a - 3\varepsilon \quad \text{for } z \in V_j.$$

Let  $\rho > 0$  be defined by  $m\rho^2 = \log(1/a)$ . Then  $\rho \leq r$  because  $m r^2 = 2C_3/\delta\varepsilon$  and  $2C_3/\delta \geq 1/a$ . So  $B(z^j, \rho) \subset B(z^j, r)$ , and if  $z \in B(z^j, \rho)$  then  $s(z) \geq a$ . The set  $\{z \in B(z^j, \rho) : \cos Q \geq a\}$  consists of certain strips in the ball  $B(z^j, \rho)$ . An easy geometric argument shows that these strips have a total area at least

$$\frac{1}{2\pi} \cdot \arccos a \cdot \sigma_n(B(z^j, \rho)) = \frac{1}{2\pi} \cdot \arccos a \cdot A(\rho).$$

Moreover  $V_j \subset B(z^j, r) \subset F_\delta$ . Using inequality (4) and the fact that the above strips are included in  $V_j$ , we get

$$(18) \quad \sigma_n(V_j) \geq \frac{1}{2\pi} \cdot \arccos a \cdot A(\rho) \geq \frac{1}{2\pi} \cdot A_1 \cdot \arccos a \cdot \rho^{2n-1}.$$

If  $\alpha \geq 1$ , we define  $V_j = B(z^j, \rho)$ . Because  $\beta_j = 0$ , it follows from (12) that

$$\begin{aligned}
 (19) \quad |v(z) + h(z) \cdot u(z)| &\geq |v(z^j)| - |v(z) - v(z^j)| - |h(z) \cdot u(z)| \\
 &\geq a - \varepsilon - |u(z)| \geq a - 2\varepsilon
 \end{aligned}$$

for  $z \in V_j$ .

Finally, we define  $K = \bigcup_{j=1}^{N(r)} \overline{V_j}$ . We observe that inequality (17) holds for  $z \in K$ . If  $z \in P$ , then  $V_0(z) = \emptyset$  and inequality (12) gives us

$$|v(z) + h(z) \cdot u(z)| \geq |v(z)| - |u(z)| \geq a - \varepsilon.$$

This altogether proves part (c) of Lemma 1. It is easy to check that  $K \cap P = \emptyset$ . Inequalities (18), (6), (9) and the definitions of  $\rho$  and  $mr^2$  yield

$$\begin{aligned} \sigma_n(K) &\geq \sigma_n\left(\bigcup_{j=1}^{N(r)} V_j\right) = \sum_{j=1}^{N(r)} \sigma_n(V_j) \\ &\geq N(r) \cdot \frac{1}{2\pi} \cdot A_1 \cdot \arccos a \cdot \rho^{2n-1} \\ &\geq \frac{C_1}{r^{2n-1}} \cdot \sigma_n(S) \cdot \frac{1}{2\pi} \cdot A_1 \cdot \arccos a \cdot \rho^{2n-1} \\ &\geq \frac{1}{4\pi} \cdot C_1 \cdot A_1 \cdot \arccos a \cdot (mr^2)^{-(2n-1)/2} \cdot (m\rho^2)^{2n-1} \cdot \sigma_n(F_\delta - P) \\ &= \varphi(a) \cdot \log(4C_3/(\delta\varepsilon))^{-(2n-1)/2} \cdot \sigma_n(F_\delta - P). \end{aligned}$$

This proves part (d) of Lemma 1. Finally, if  $|z| \leq R$  then  $\operatorname{Re}(1 - \langle z, z^j \rangle) \leq 1 - R$  for  $j = 1, 2, \dots, N(r)$ . Because of the inequalities  $mr^2 \geq 1$ , (10) and (6), we have

$$\begin{aligned} |u(z)| &\leq N(r) \cdot e^{-m(1-R)} \leq C_2 \cdot \frac{1}{r^{2n-1}} \cdot e^{-m(1-R)} \\ &= C_2 \cdot m^{(2n-1)/2} \cdot e^{-m(1-R)} \cdot (mr^2)^{-(2n-1)/2} \\ &\leq C_2 \cdot m^{(2n-1)/2} \cdot e^{-m(1-R)} \leq \varepsilon. \end{aligned}$$

This proves part (d) of Lemma 1 and ends the proof.

**LEMMA 2.** *Let  $v$  be a continuous map  $v: S^n \rightarrow \mathbf{C}^m$  such that  $\|v\|_\delta < b < 1$  for some  $\delta < C_3$ . Let  $\frac{1}{4} > \varepsilon > 0$ ,  $R < 1$ . Then there exists a holomorphic map  $u: \mathbf{C}^n \rightarrow \mathbf{C}^m$  and a closed set  $K \subset F_\delta$  such that:*

- (a)'  $\|v + h \cdot u\|_\delta < b + \varepsilon$ ;
- (b)'  $\|u\|_R \leq \varepsilon$ ;
- (c)'  $|v(z) + h(z) \cdot u(z)| > b - \varepsilon$ ;
- (d)'  $\sigma_n(K) \geq \sigma_n(F_\delta) - \varepsilon$ ;
- (e)'  $|u(z)| \leq \varepsilon$  for  $z \in S^n - F_\delta$ ;
- (f)'  $u_j \equiv 0$  for  $j = 1, 2, \dots, m-1$ , where  $u = (u_1, u_2, \dots, u_m)$ .

*Proof.* Let  $a = b - \frac{1}{2}\varepsilon$  and choose a sequence  $\{\varepsilon_j\}$  satisfying the assumptions of Lemma 1 and such that  $6\sum_{j=1}^{\infty} \varepsilon_j < \varepsilon$ . We can assume  $\varepsilon_j = A \cdot \exp\{-(\tau \cdot j)^{2/(2n-1)}\}$ ,  $A = 2C_3/\delta$  and  $\tau$  is some large number.

Apply Lemma 1 to the data  $a, \varepsilon_1, R, v, P = \emptyset$  to produce a holomorphic map  $u_1: \mathbf{C}^n \rightarrow \mathbf{C}^m$  and a closed set  $K_1 \subset F_\delta$  such that:

- (a)<sub>1</sub>  $\|v + h \cdot u_1\|_\delta \leq b + 3\varepsilon_1$ ;
- (b)<sub>1</sub>  $\|v_1\|_R \leq \varepsilon_1$ ;
- (c)<sub>1</sub>  $|v(z) + h(z) \cdot u_1(z)| \geq a - 3\varepsilon_1$  for  $z \in K_1$ ;
- (d)<sub>1</sub>  $\alpha_1 = \sigma_n(K_1) \geq \varphi(a) \cdot [\log(A/\varepsilon_1)]^{-(2n-1)/2} \cdot \sigma_n(F_\delta)$ ;
- (e)<sub>1</sub>  $|u_1(z)| \leq \varepsilon_1$  for  $z \in S^n - F_\delta$ ;
- (f)<sub>1</sub>  $u_j^1 \equiv 0$  for  $j = 1, 2, \dots, m - 1$ , where  $u_1 = (u_1^1, u_2^1, \dots, u_m^1)$ .

Suppose that holomorphic maps  $u_1, u_2, \dots, u_{p-1}$  ( $u_j: \mathbf{C}^n \rightarrow \mathbf{C}^m$  for  $j = 1, 2, \dots, p - 1$ ) have been chosen together with closed sets  $K_1, K_2, \dots, K_{p-1}$  such that if  $W_i = \bigcup_{j=1}^i K_j$  then  $K_{i+1} \cap W_i = \emptyset$  and  $\sigma_n(K_i) = \alpha_i, K_i \subset F_\delta$ . A map  $u_p: \mathbf{C}^n \rightarrow \mathbf{C}^m$  and a closed set  $K_p$  is then obtained by applying Lemma 1 to the data  $a - 3\sum_{i=1}^{p-1} \varepsilon_i, \varepsilon_p, R, v + h(z) \cdot (u_1 + u_2 + \dots + u_{p-1}), W_{p-1}$ . This produces a sequence  $\{v_k\}$  of holomorphic maps ( $v_k: \mathbf{C}^n \rightarrow \mathbf{C}^m$  for  $k = 1, 2, \dots$ ) and a sequence  $\{K_k\}$  of disjoint closed sets such that  $K_k \subset F_\delta, \sigma_n(K_k) = \alpha_k$  and:

- (a)<sub>p</sub>  $\|v + h \cdot \sum_{k=1}^p u_k\|_\delta \leq b + 3 \cdot \sum_{k=1}^p \varepsilon_k < b + \varepsilon$ ;
- (b)<sub>p</sub>  $\left\| \sum_{k=1}^p u_k \right\|_R \leq \sum_{k=1}^p \|u_k\|_R \leq \sum_{k=1}^p \varepsilon_k < \varepsilon$ ;
- (c)<sub>p</sub>  $\left| v(z) + h(z) \cdot \sum_{k=1}^p u_k(z) \right| \geq a - 3 \cdot \sum_{k=1}^p \varepsilon_k$   
 $\geq a - \frac{1}{2}\varepsilon = b - \varepsilon$  for  $z \in W_p$ ;
- (d)<sub>p</sub>  $\alpha_p = \sigma_n(K_p)$   
 $\geq \varphi\left(a - 3 \cdot \sum_{k=1}^{p-1} \varepsilon_k\right) \cdot \left[\log \frac{A}{\varepsilon_p}\right]^{-(2n-1)/2} \cdot \left(\sigma_n(F_\delta) - \sum_{k=1}^{p-1} \alpha_k\right)$   
 $\geq \varphi(a) \cdot \left[\log \frac{A}{\varepsilon_p}\right]^{-(2n-1)/2} \cdot \left(\sigma_n(F_\delta) - \sum_{k=1}^{p-1} \alpha_k\right)$ ;
- (e)<sub>p</sub>  $\left| \sum_{k=1}^p u_k(z) \right| \leq \sum_{k=1}^p |u_k(z)| \leq \sum_{k=1}^p \varepsilon_k < \varepsilon$  for  $z \in S^n - F_\delta$ ;
- (f)<sub>p</sub>  $u_j^k \equiv 0$  for  $k = 1, 2, \dots, p$  and  $j = 1, 2, \dots, m - 1$ ,

where  $u_k = (u_1^k, u_2^k, \dots, u_m^k)$ .

If  $\sum_{k=1}^{\infty} \alpha_k < \sigma_n(F_\delta)$ , (d) shows that there is a constant  $C_4$  such that for every positive integer  $k$ ,

$$\alpha_p \geq C_4 \cdot \left[ \log \frac{A}{\varepsilon_p} \right]^{-(2n-1)/2} = \left[ C_4 \cdot (\tau p)^{2/(2n-1)} \right]^{-(2n-1)/2} = \frac{C_4}{\tau p}.$$

This is impossible, because then  $\sum_{p=1}^{\infty} \alpha_p = \infty$  and  $\alpha_p$  are the measures of the disjoint sets. Hence, we may assume that  $\sum_{k=1}^{\infty} \alpha_k = \sigma_n(F_\delta)$ . It follows that for  $p$  sufficiently large and  $P = W_p$  we have  $\sigma_n(P) = \sum_{k=1}^p \alpha_k > 1 - \varepsilon$ , which is part (d)' of Lemma 2. Letting  $h = \sum_{k=1}^p u_k$ , parts (a)', (b)', (c)', (e)', (f)' are just (a)<sub>p</sub>, (b)<sub>p</sub>, (c)<sub>p</sub>, (e)<sub>p</sub>, (f)<sub>p</sub>. So we have proved the assertion of Lemma 2.

Assume now that  $g$  and  $h$  satisfy the assumptions of the Theorem. Then  $\|g\|_\delta \leq 1 - \delta$ . To prove the Theorem, take a sequence  $\delta_1, \delta_2, \dots$  of positive numbers such that  $\delta_1 < C_3$  and  $\delta_{i+1} < \delta_i/2$  and let  $a_1 = b_1 = 1 - \frac{1}{2}\delta_1$ ,  $\varepsilon_1 = \min(\frac{1}{16}, \frac{1}{4}\delta_1)$ ,  $R_1 = \frac{1}{2}$ . Apply Lemma 2 to the data  $g_1 = g$ ,  $b_1, \delta_1, R_1$  to get a map  $u_1$  and a set  $K_1 \subset F_{\delta_1}$  such that, for  $p = 1$  and  $g_1 = g$ :

- (i)<sub>p</sub>  $\|g_p + h \cdot u_p\|_{\delta_p} < b_p + \varepsilon_p < 1$ ;
- (ii)<sub>p</sub>  $\|u_p\|_{R_p} \leq \varepsilon_p$ ;
- (iii)<sub>p</sub>  $|g_p(z) + h(z) \cdot u_p(z)| > b_p - \varepsilon_p$  for  $z \in K_p$ ;
- (iv)<sub>p</sub>  $\sigma_n(K_p) \geq \sigma_n(F_{\delta_p}) - \varepsilon_p$ ;
- (v)<sub>p</sub>  $1 - |g_p(z) + h(z) \cdot u_p(z)|$   
 $\geq \left(1 - \sum_{i=1}^p \varepsilon_i\right) |h(z)|$  for  $z \in S^n - F_{\delta_p}$ ;
- (vi)<sub>p</sub>  $u_j^p \equiv 0$  for  $j = 1, 2, \dots, m-1$  where  $u_p = (u_1^p, u_2^p, \dots, u_m^p)$ .

Inequality (v) follows from (e)' of Lemma 2, because for  $z \in S^n - F_{\delta_1}$ , we have  $|u_1(z)| < \varepsilon_1$ , so

$$\begin{aligned} 1 - |v(z) + h(z) \cdot u_1(z)| &\geq 1 - |v(z)| - |u_1(z) \cdot h(z)| \\ &\geq |h(z)| - \varepsilon_1 \cdot |h(z)| = (1 - \varepsilon_1) \cdot |h(z)|. \end{aligned}$$

Since  $g_1 + h \cdot u_1$  is a continuous map on  $\bar{B}^n$ , there exists an  $R_2$  such that  $\frac{1}{2} + \frac{1}{2}R_1 < R_2 < 1$  and, for  $p = 1$ ,

- (vii)<sub>p</sub>  $|g_p(R_{p+1} \cdot z) + h(R_{p+1} \cdot z) \cdot u_p(R_{p+1} \cdot z)| > b_p - 2\varepsilon_p$   
for  $z \in K_p$ .

Suppose we have inductively found holomorphic maps  $u_1, u_2, \dots, u_p$ , closed sets  $K_1, K_2, \dots, K_p$ , real numbers  $R_1, R_2, \dots, R_{p+1}$ ,  $b_1, b_2, \dots, b_p$ ,  $\varepsilon_1, \varepsilon_2, \dots, \varepsilon_p$  such that  $\frac{1}{2} + \frac{1}{2}R_i < R_{i+1}$ ,  $\varepsilon_i > 0$  for  $i = 1, 2, \dots, p$  and  $\sum_{i=1}^p \varepsilon_i < 1/8$ . Let us assume  $g_{j+1} = g + h \cdot \sum_{i=1}^j u_i$  and conditions (i)<sub>j</sub>–(vii)<sub>j</sub> are satisfied for  $j = 1, 2, \dots, p$ . We also assume that  $1 - 1/j \leq b_j < b_j + \varepsilon_j < 1$ . If  $z \in (F_{\delta_{p+1}} - F_{\delta_p})$  then according to (v)<sub>p</sub>, we have

$$1 - |g_{p+1}(z)| \geq \left(1 - \sum_{i=1}^p \varepsilon_i\right) \cdot |h(z)| \geq \frac{1}{2} \cdot \delta_{p+1}$$

since  $|h(z)| \geq \delta_{p+1}$ . This, together with (i)<sub>p</sub>, shows that  $\|g_{p+1}\|_{\delta_{p+1}} < 1$ . Take any  $b_{p+1} > 1 - 1/(p+1)$  and  $\varepsilon_{p+1}$  satisfying the inequalities  $1 > b_{p+1} + \varepsilon_{p+1} > b_{p+1} > \|g_{p+1}\|_{\delta_{p+1}}$  and  $\sum_{i=1}^{p+1} \varepsilon_i < 1/8$ . Since the map  $g_{p+1}$  is continuous on  $B^n$ , we can find a number  $R_{p+2}$  such that  $\frac{1}{2} + \frac{1}{2}R_{p+1} < R_{p+2} < 1$  and such that condition (vii)<sub>p+1</sub> is satisfied. Now we can apply Lemma 2 to the data  $g_{p+1}, b_{p+1}, \varepsilon_{p+1}, R_{p+1}$ . We get some map  $u_{p+1}$  and a set  $K_{p+1}$ . It follows from Lemma 2 that conditions (i)<sub>p+1</sub>–(iv)<sub>p+1</sub> and (vi)<sub>p+1</sub> are satisfied. For  $z \in S^n - F_{\delta_{p+1}}$ , by the virtue of (e)' and (v)<sub>p</sub>, we have

$$\begin{aligned} 1 - |g_{p+1}(z) + h(z) \cdot u_{p+1}(z)| & \\ \geq 1 - |g_p(z) + h(z) \cdot u_p(z)| - |h(z) \cdot u_{p+1}(z)| & \\ \geq \left(1 - \sum_{i=1}^p \varepsilon_i\right) \cdot |h(z)| - |h(z)| \cdot \varepsilon_{p+1} & \\ = \left(1 - \sum_{i=1}^{p+1} \varepsilon_i\right) \cdot |h(z)|. & \end{aligned}$$

So we have also proved that condition (v)<sub>p+1</sub> is satisfied. Conditions (ii)<sub>p</sub> ( $p = 1, 2, 3, \dots$ ) and the definition of  $g_p$  say that the sequence  $\{g_p\}$  is convergent uniformly on every ball  $R_p \cdot B^n$ , and since  $\lim_{p \rightarrow 1} R_p = 1$ , this sequence is pointwise convergent to some holomorphic map  $f$  on the ball  $B^n$ . From conditions (i)<sub>p</sub> and (v)<sub>p</sub> it follows that each map  $g_p$  is bounded by 1 on  $B^n$ . So, also  $\|f\|_\infty \leq 1$ . For  $\delta > 0$  let  $L_p = F_\delta \cap \cap_{j>p} K_j$ . Then, for  $q$  large enough,  $F_\delta \subset F_{\delta_q}$  for  $p > q$ . We have

$$\begin{aligned} \sigma_n(F_\delta) - \sigma_n(L_q) &= \sigma_n\left(\bigcup_{j>q} (F_\delta - (F_\delta \cap K_j))\right) \\ &\leq \sum_{j>q} \sigma_n(F_\delta - (F_\delta \cap K_j)) \leq \sum_{j>q} \sigma_n(F_\delta - K_j) < \sum_{j>q} \varepsilon_j. \end{aligned}$$

Hence  $\lim_{q \rightarrow \infty} \sigma_n(L_q) = \sigma_n(F_\delta)$ . It is obvious from (iii)<sub>p</sub> and the equality  $\lim_{p \rightarrow \infty} b_p = 1$  that  $\lim_{R \rightarrow 1} f(Rz) = 1$  for  $z \in L_q$ , provided this limit exists. Since  $\delta$  was arbitrary, this proves that the map  $f$  is inner, since  $\sigma_n(\cap_p (S^n - F_{\delta_p})) = 0$ . Now it is easy to check that  $f$  satisfies the Theorem.

**COROLLARY 3.** *Let  $m < n$  and let  $g \in A_m(B^m)$ ,  $\|g\|_\infty \leq 1$ . There exists an inner map  $f: B^n \rightarrow B^m$  such that*

$$f(z_1, z_2, \dots, z_m, 0, 0, \dots, 0) = g(z_1, z_2, \dots, z_m).$$

*Proof.* Let  $\Phi: B^m \rightarrow B^m$  be an automorphism of  $B^m$  such that  $\Phi(g(0, \dots, 0)) = (0, \dots, 0)$ . Take  $\tilde{g}: B^m \rightarrow B^m$ ,  $\tilde{g}(z) = \Phi(g(z_1, z_2, \dots, z_m))$ ,  $h(z) = \frac{1}{2} \cdot z_n^2$ . By virtue of Schwartz's lemma,

$$|\tilde{g}(z)| \leq \left( |z_1|^2 + |z_2|^2 + \dots + |z_m|^2 \right)^{1/2}.$$

So we have

$$|\tilde{g}(z)| + |h(z)| \leq \left( 1 - |z_n|^2 \right)^{1/2} + \frac{1}{2} \cdot |z_n|^2 \leq 1.$$

We can apply the Theorem for  $g$  and  $h$  to get an inner map  $\tilde{f}$ . The inner map  $f = \Phi^{-1}(\tilde{f})$  will satisfy Corollary 3.

**COROLLARY 4.** *There exists an inner function  $f: B^n \rightarrow D$  such that*

$$\frac{\partial f}{\partial z_1}(0, 0, \dots, 0) = 1.$$

*Proof.* Take  $m = 1$  in Corollary 3 and a function  $g: B^1 \rightarrow D$ ,  $g(z) = z$ .

**REMARK.** The assumption  $g \in A_m(B^m)$  in Corollary 3 is not necessary: we can take any holomorphic map  $g: B^m \rightarrow B^m$ . Then the map  $\tilde{g}$ , defined as before, can be prolonged to a continuous map on  $\bar{B}^n - A$ , where  $A \subset S^n$  and  $\sigma_n(A) = 0$ . One can check that the Theorem is still valid for such maps.
