# Semiclassical singularities propagation property for Schrödinger equations 

By Shu Nakamura

(Received May 30, 2006)
(Revised Jan. 26, 2008)

#### Abstract

We consider Schrödinger equations with variable coefficients, which are long-range type perturbations of the flat Laplacian on $\boldsymbol{R}^{n}$. We characterize the wave front set of solutions to Schrödinger equations in terms of the initial state. Then it is shown that the singularities propagates along the classical flow, and results are formulated in a semiclassical setting. Methods analogous to the long-range scattering theory, in particular a modified free propagator, are employed.

## 1. Introduction.

Let $H$ be a Schrödinger operator with variable coefficients:

$$
H=-\frac{1}{2} \sum_{j, k=1}^{n} \partial_{x_{j}} a_{j k}(x) \partial_{x_{k}}+V(x) \quad \text { on } L^{2}\left(\boldsymbol{R}^{n}\right),
$$

where $n \geq 1$ is the space dimension. Throughout this paper, we always assume $a_{j k}(x)$ and $V(x)$ are real-valued $C^{\infty}$-class functions. Moreover, we assume:

Assumption A. For each $x \in \boldsymbol{R}^{n},\left(a_{j k}(x)\right)_{j, k}$ is a positive symmetric matrix. There is $\mu>0$ such that for any multi-index $\alpha \in \boldsymbol{Z}_{+}^{n}$, there is $C_{\alpha}$ such that

$$
\begin{array}{rlrl}
\left|\partial_{x}^{\alpha}\left(a_{j k}(x)-\delta_{j k}\right)\right| & \leq C_{\alpha}\langle x\rangle^{-\mu-|\alpha|}, & & x \in \boldsymbol{R}^{n}, \\
\left|\partial_{x}^{\alpha} V(x)\right| \leq C_{\alpha}\langle x\rangle^{2-\mu-|\alpha|}, & & x \in \boldsymbol{R}^{n} .
\end{array}
$$

Then it is well-known that $H$ is essentially self-adjoint on $C_{0}^{\infty}\left(\boldsymbol{R}^{n}\right)$, and we denote the unique self-adjoint extension by the same symbol $H$. We let $u(t)=$

[^0]$e^{-i t H} u_{0}$ be the solution to the time-dependent Schrödinger equation:
$$
i \frac{\partial}{\partial t} u(t)=H u(t), \quad u(0)=u_{0}, \quad u_{0} \in L^{2}\left(\boldsymbol{R}^{n}\right)
$$

We study the microlocal singularity of $u(t)$. In particular, we characterize the wave front set of $u(t)$ in the nontrapping region, in terms of $u_{0}$. In order to describe our main result, we introduce several notations of the classical flow corresponding to $H$. Let $k(x, \xi)$ be the classical kinetic energy, and let $p(x, \xi)$ be the full Hamiltonian (modulo lower order terms):

$$
k(x, \xi)=\frac{1}{2} \sum_{j, k=1}^{n} a_{j k}(x) \xi_{j} \xi_{k}, \quad p(x, \xi)=k(x, \xi)+V(x), \quad x, \xi \in \boldsymbol{R}^{n}
$$

Let $\exp t H_{q}$ denote the Hamilton flow generated by a symbol $q$, i.e., if $(x(t), \xi(t))=$ $\exp t H_{q}\left(x_{0}, \xi_{0}\right)$, then $(x(t), \xi(t))$ is the solution to the Hamilton equation:

$$
\frac{d}{d x} x(t)=\frac{\partial q}{\partial \xi}(x(t), \xi(t)), \quad \frac{d}{d x} \xi(t)=-\frac{\partial q}{\partial x}(x(t), \xi(t)), \quad t \in \boldsymbol{R}
$$

with $x(0)=x_{0}, \xi(0)=\xi_{0}$.
Definition 1. For $\left(x_{0}, \xi_{0}\right) \in \boldsymbol{R}^{n} \times \boldsymbol{R}^{n}$, we denote $(\tilde{y}(t), \tilde{\eta}(t))=$ $\exp t H_{k}\left(x_{0}, \xi_{0}\right) .\left(x_{0}, \xi_{0}\right)$ is called backward nontrapping if $|\tilde{y}(t)| \rightarrow \infty$ as $t \rightarrow-\infty$.

For $a \in C^{\infty}\left(\boldsymbol{R}^{2 n}\right)$, we denote the Weyl quantization by $a\left(x, D_{x}\right)$ :

$$
a\left(x, D_{x}\right) u(x)=(2 \pi)^{-n} \int e^{i(x-y) \cdot \xi} a\left(\frac{x+y}{2}, \xi\right) u(y) d y d \xi
$$

where $u \in \mathscr{S}\left(\boldsymbol{R}^{n}\right)$ (see, e.g., Hörmander [10]). We recall $\left(x_{0}, \xi_{0}\right) \notin W F(u)$, the wave front set of $u$, if and only if there exists $a \in C_{0}^{\infty}\left(\boldsymbol{R}^{2 n}\right)$ such that $a\left(x_{0}, \xi_{0}\right) \neq 0$ and

$$
\left\|a_{h}\left(x, D_{x}\right) u\right\|=O\left(h^{\infty}\right) \quad \text { as } h \rightarrow 0
$$

where $a_{h}(x, \xi)=a(x, h \xi)$ (see, e.g., Martinez [14], Dimassi and Sjöstand [5]).
Theorem 1.1. Suppose $H$ satisfies Assumption $A$, and let $u(t)=e^{-i t H} u_{0}$, $u_{0} \in L^{2}\left(\boldsymbol{R}^{n}\right)$. Suppose, moreover, $\left(x_{0}, \xi_{0}\right)$ is backward nontrapping, and let $t_{0}>0$. Then $\left(x_{0}, \xi_{0}\right) \notin W F\left(u\left(t_{0}\right)\right)$ if and only if there exists $a \in C_{0}^{\infty}\left(\boldsymbol{R}^{2 n}\right)$ such that
$a\left(x_{0}, \xi_{0}\right) \neq 0$ and

$$
\left\|\left(a_{h} \circ \exp t_{0} H_{p}\right)\left(x, D_{x}\right) u_{0}\right\|=O\left(h^{\infty}\right) \quad \text { as } h \rightarrow 0
$$

The main idea of the proof is very simple. Let $a \in C_{0}^{\infty}\left(\boldsymbol{R}^{2 n}\right)$ such that $a\left(x_{0}, \xi_{0}\right) \neq 0$ and supported in a small neighborhood of $\left(x_{0}, \xi_{0}\right)$. We note

$$
\left\|a_{h}\left(x, D_{x}\right) u\left(t_{0}\right)\right\|=\left\|e^{i t_{0} H} a_{h}\left(x, D_{x}\right) e^{-i t_{0} H} u_{0}\right\| .
$$

If we formally apply the semiclassical Egorov theorem, we learn that the principal symbol of $e^{i t_{0} H} a_{h}\left(x, D_{x}\right) e^{-i t_{0} H} u_{0}$ is given by $a_{h} \circ \exp t_{0} H_{p}$, and we can obtain an asymptotic expansion of the symbol, where all the terms are supported in $\exp \left(-t_{0} H_{p}\right)\left(\operatorname{supp} a_{h}\right)$. If this argument is justified, Theorem 1 follows immediately. However, in order to justify this argument in this framework, we need to find a suitable symbol class, which might be time-dependent. Instead of introducing time-dependent symbol class, we employ a scattering theoretical technique, which is an extension of the method used in [17].

Let $W(t, \xi)$ be a solution to the momentum space Hamilton-Jacobi equation: $\frac{\partial W}{\partial t}(t, \xi)=p\left(\frac{\partial W}{\partial \xi}(t, \xi), \xi\right)$, which is constructed in Section 2. We study

$$
\Omega(t):=e^{i W\left(t, D_{x}\right)} e^{-i t H}
$$

instead of $e^{-i t H}$ itself. Let

$$
\left(y\left(t ; x_{0}, \xi_{0}\right), \eta\left(t ; x_{0}, \xi_{0}\right)\right)=\exp t H_{p}\left(x_{0}, \xi_{0}\right)
$$

If $\left(x_{0}, \xi_{0}\right)$ is backward nontrapping, then it is shown in Section 2 that

$$
\begin{aligned}
& \xi_{-}\left(-t_{0} ; x_{0}, \xi_{0}\right):=\lim _{\lambda \rightarrow+\infty} \lambda^{-1} \eta\left(-t_{0} ; x_{0}, \lambda \xi_{0}\right), \\
& z_{-}\left(-t_{0} ; x_{0}, \xi_{0}\right):=\lim _{\lambda \rightarrow+\infty}\left(y\left(-t_{0} ; x_{0}, \lambda \xi_{0}\right)-\frac{\partial W}{\partial \xi}\left(-t_{0}, \eta\left(-t_{0} ; x_{0}, \lambda \xi_{0}\right)\right)\right)
\end{aligned}
$$

exist. We will see that actually $\xi_{-}$and $z_{-}$are independent of $t_{0}$. We will show:
Theorem 1.2. Suppose $H$ satisfies Assumption A, and let $u(t),\left(x_{0}, \xi_{0}\right)$, $t_{0}>0$ be as in Theorem 1.1. Then $\left(x_{0}, \xi_{0}\right) \in W F\left(u\left(t_{0}\right)\right)$ if and only if

$$
\left(z_{-}\left(-t_{0} ; x_{0}, \xi_{0}\right), \xi_{-}\left(-t_{0} ; x_{0}, \xi_{0}\right)\right) \in W F\left(e^{i W\left(-t_{0}, D_{x}\right)} u_{0}\right)
$$

Since the symbol of

$$
e^{i W\left(-t_{0}, D_{x}\right)}\left(a_{h} \circ \exp t_{0} H_{p}\right)\left(x, D_{x}\right) e^{-i W\left(-t_{0}, D_{x}\right)}
$$

is essentially supported in a small neighborhood of $\left(z_{-}, \xi_{-}\right)$, Theorem 1.1 follows from Theorem 1.2 (see Subsection 3.4 for the detail). Theorem 1.2 is proved using an Egorov-type theorem for $\Omega(t) a_{h}\left(x, D_{x}\right) \Omega(t)^{-1}$. We note, at least formally,

$$
\begin{aligned}
\frac{d}{d t} \Omega(t) & =i \frac{\partial W}{\partial t}\left(t, D_{x}\right) \Omega(t)-i e^{i W\left(t, D_{x}\right)} H e^{-i t H} \\
& =-i\left\{e^{i W\left(t, D_{x}\right)} H e^{-i W\left(t, D_{x}\right)}-\frac{\partial W}{\partial t}\left(t, D_{x}\right)\right\} \Omega(t) \\
& =-i L(t) \Omega(t) .
\end{aligned}
$$

Namely, $\Omega(t)$ is the evolution operator generated by the time-dependent selfadjoint operator $L(t)$. The principal symbol of $L(t)$ is given by

$$
p\left(x+\frac{\partial W}{\partial \xi}(t, \xi), \xi\right)-\frac{\partial W}{\partial t}(t, \xi)=p\left(x+\frac{\partial W}{\partial \xi}(t, \xi), \xi\right)-p\left(\frac{\partial W}{\partial \xi}(t, \xi), \xi\right)
$$

by virtue of the Hamilton-Jacobi equation. This symbol is $O\left(\langle\zeta\rangle^{1-\mu}\right)$ if $t \neq 0$, and hence the speed of the propagation of singularity for $L(t)$ is 0 away from $t=0$. However, at $t=0, L(0)$ has infinite propagation speed, and we observe a jump of the singularity. This propagation of singularity is described by the flow: $t \mapsto\left(z_{-}\left(t ; x_{0}, \xi_{0}\right), \xi_{-}\left(t ; x_{0}, \xi_{0}\right)\right)$, and we can conclude Theorem 1.2.

The study of microlocal singularities of solutions to Schrödinger equation goes back at least to a work by Boutet de Monvel [2] (see also Lascar [13], Yamazaki [25], Zelditch [26]). Investigation to characterize the wave front set of $u(t)$ in terms of the initial state $u_{0}$ for variable coefficients Schrödinger equation was started by a work of Craig, Kappeler and Strauss [4]. They showed that the solution is microlocally smooth along a nontrapping geodesic if the initial state decays rapidly in a conic neighborhood of $-\xi=-\lim _{t \rightarrow-\infty} \xi(t)$. This property is called the microlocal smoothing property, and it was generalized and refined by Wunsch [23], Nakamura [16] and Ito [11]. The microlocal smoothing property in the analytic category was studied by Robbiano and Zuily [19], [20] and Martinez, Nakamura and Sordoni [15]. Results in this paper may be considered as refinements of these works, and the microlocal smoothing property (in the $C^{\infty}$-category) follows immediately from Theorem 1.1. Similar characterization of wave front set for solutions to Schrödinger equation is recently obtained by Hassel and Wunsch [8]. They con-
sidered the problem in the framework of scattering metric, and the assumptions and the proof are quite different from ours. In a previous paper, Nakamura [17] considered the case of short-range perturbations, i.e., $\mu>1$, and the results in this paper are its generalizations.

On the other hand, the singularity of solutions to perturbed harmonic oscillator Schrödinger equation was studied by Zelditch [26], Yajima [24], Kapitanski, Rodnianskiand Yajima [12] and Doi [6], [7]. The idea of these papers, especially those by Doi, is closely related to our proof.

Recently, Strichartz estimates for variable coefficient Schrödinger operator were studied by several authors, e.g., Staffilani and Tataru [22], Robbiano and Zuily [21], Burq, Gérard and Tzvetkov [3], Bouclet and Tzvetkov [1]. The Strichartz estimate is another expression of the smoothing property of Schrödinger equations, and there should be implicit relationship with our results. In particular, Bouclet and Tzvetkov used the Isozaki-Kitada modifier to treat long-range perturbations, and it is analogous to our modified free propagator, though the formulation and the construction are completely different.

The paper is organized as follows: In Section 2, we consider the classical motions generated by the kinetic energy and the total Hamiltonian. In particular, we construct a solution to the momentum space Hamilton-Jacobi equation and show the existence of the modified classical wave operator. We prove Theorems 1.2 and then Theorem 1.1 in Section 3.

Throughout this paper, we use the following notation: $S(m, g)$ denotes the Hörmander symbol class (cf. Hörmander [10], Chapter 18). For a compact set $K \subset$ $\boldsymbol{R}^{n}, S_{K}(m, g)$ denotes the same symbol class restricted to functions on $K \times \boldsymbol{R}^{n}$. For a symbol $a(x, \xi), a\left(x, D_{x}\right)$ denotes the Weyl quantization of $a$.

Acknowledgments. The author would like to thank the referee for pointing out numerous errors in the first version, and for providing valuable suggestions. He also thanks Kenji Yajima, André Martinez, Shin-ichi Doi and Ken-ichi Ito for valuable discussions and comments.

## 2. Hamilton flows and solution to the Hamilton-Jacobi equation.

### 2.1. Properties of nontrapping geodesic flow.

Here we consider the Hamilton flow for the kinetic energy: $k(x, \xi)=$ $\frac{1}{2} \sum a_{j k}(x) \xi_{j} \xi_{k}$. We always suppose Assumption A is satisfied.

Proposition 2.1. Let $\left(x_{0}, \xi_{0}\right) \in \boldsymbol{R}^{2 n}$ and suppose $\left(x_{0}, \xi_{0}\right)$ is backward nontrapping. Then there exists $C>0$ such that

$$
|\tilde{y}(t)| \geq C^{-1}|t|-C, \quad t \leq 0
$$

where

$$
(\tilde{y}(t), \tilde{\eta}(t))=\left(\tilde{y}\left(t ; x_{0}, \xi_{0}\right), \tilde{\eta}\left(t ; x_{0}, \xi_{0}\right)\right)=\exp t H_{k}\left(x_{0}, \xi_{0}\right)
$$

Moreover, $C$ may be taken locally uniformly with respect to $\left(x_{0}, \xi_{0}\right)$
Proof. At first we recall the conservation of the energy:

$$
k(\tilde{y}(t), \tilde{\eta}(t))=\frac{1}{2} \sum_{j, k} a_{j k}(\tilde{y}(t)) \tilde{\eta}_{j}(t) \tilde{\eta}_{k}(t)=k\left(x_{0}, \xi_{0}\right)
$$

By the uniform ellipticity of $k(x, \xi)$, we learn that there exists $C_{1}>0$ such that

$$
C_{1}^{-1} \leq|\tilde{\eta}(t)| \leq C_{1}, \quad t \in \boldsymbol{R} .
$$

We compute

$$
\begin{aligned}
\frac{d^{2}}{d t^{2}}|\tilde{y}(t)|^{2} & =2 \frac{d}{d t}\left(\tilde{y}(t) \cdot \frac{d \tilde{y}}{d t}(t)\right)=2 \frac{d}{d t}\left(\sum_{j, k} a_{j k}(\tilde{y}(t)) \tilde{y}_{j}(t) \tilde{\eta}_{k}(t)\right) \\
& =4 k(\tilde{y}(t), \tilde{\eta}(t))+\tilde{U}(\tilde{y}(t), \tilde{\eta}(t)),
\end{aligned}
$$

where

$$
\begin{aligned}
\tilde{U}(x, \xi)= & 2 \sum_{j, k, \ell} a_{j k}(x)\left(a_{j \ell}(x)-\delta_{j \ell}\right) \xi_{\ell} \xi_{k} \\
& -\sum_{j, k, \ell, m} a_{j k}(x) \frac{\partial a_{\ell m}}{\partial x_{k}}(x) x_{j} \xi_{\ell} \xi_{m}+2 \sum_{j, k, \ell, m} \frac{\partial a_{j k}}{\partial x_{\ell}}(x) a_{\ell m}(x) x_{j} \xi_{k} \xi_{m} .
\end{aligned}
$$

By Assumption A, it is easy to see

$$
|\tilde{U}(x, \xi)| \leq C\langle x\rangle^{-\mu}|\xi|^{2}
$$

and this implies

$$
\frac{d^{2}}{d t^{2}}|\tilde{y}(t)|^{2} \geq 4 k\left(x_{0}, \xi_{0}\right)-C\langle\tilde{y}(t)\rangle^{-\mu}|\tilde{\eta}(t)|^{2}
$$

We can choose $R>0$ so large that

$$
4 k\left(x_{0}, \xi_{0}\right)-C R^{-\mu} C_{1}^{2} \geq \varepsilon>0
$$

Since $\left(x_{0}, \xi_{0}\right)$ is backward nontrapping, there exists $t_{0}<0$ such that

$$
\left|\tilde{y}\left(t_{0}\right)\right|>R, \quad \frac{d}{d t}\left|\tilde{y}\left(t_{0}\right)\right|<0
$$

and hence

$$
\frac{d^{2}}{d t^{2}}|\tilde{y}(t)|^{2} \geq \varepsilon, \quad t \leq t_{0}
$$

Then by the convexity of $|\tilde{y}(t)|^{2}$, we conclude

$$
|\tilde{y}(t)|^{2} \geq R^{2}+\frac{\varepsilon\left(t_{0}-t\right)^{2}}{2}, \quad t \leq t_{0}
$$

and the assertion follows immediately. Since $\tilde{y}\left(t ; x_{0}, \xi_{0}\right)$ depends continuously on ( $t ; x_{0}, \xi_{0}$ ), the constants $C$ may be taken locally uniformly.

Proposition 2.2. Suppose $\left(x_{0}, \xi_{0}\right)$ is backward nontrapping. Then

$$
\xi_{-}:=\lim _{t \rightarrow-\infty} \tilde{\eta}\left(t ; x_{0}, \xi_{0}\right)
$$

exists.
Proof. By Proposition 2.1 and Assumption A, we learn

$$
\begin{aligned}
\frac{d}{d t} \tilde{\eta}_{j}(t) & =-\frac{1}{2} \sum_{k, \ell}\left(\partial_{x_{j}} a_{k \ell}\right)(\tilde{y}(t)) \tilde{\eta}_{k}(t) \tilde{\eta}_{\ell}(t) \\
& =O\left(|\tilde{y}(t)|^{-1-\mu}\right)=O\left(\langle t\rangle^{-1-\mu}\right)
\end{aligned}
$$

as $t \rightarrow-\infty$. Hence

$$
\xi_{-}=\lim _{t \rightarrow-\infty} \tilde{\eta}(t)=\xi_{0}-\int_{-\infty}^{0} \frac{d}{d t} \tilde{\eta}(t) d t
$$

exists.
By the above proof, we also observe

$$
\left|\xi_{-}-\tilde{\eta}(t)\right| \leq C\langle t\rangle^{-\mu}, \quad t \rightarrow-\infty,
$$

and $C$ can be taken locally uniformly in $\left(x_{0}, \xi_{0}\right)$. Let $0<\delta_{1}<1, R>0$, and we set

$$
\Omega_{R, \delta_{1}}=\left\{\left.(x, \xi) \in \boldsymbol{R}^{2 n}\left|R-1<|x|<R+1, \frac{1}{2}<|\xi|<2, x \cdot \xi \leq-\delta_{1}\right| x| | \xi \right\rvert\,\right\}
$$

be a neighborhood of $\left\{(x,-x /|x|) \in \boldsymbol{R}^{2 n}| | x \mid=R\right\}$. We fix $\delta_{1}>0$. If $R$ is sufficiently large, we have

$$
\begin{aligned}
\left.\frac{d}{d t}|\tilde{y}(t)|^{2}\right|_{t=0} & =2 \sum_{j, k} a_{j k}(x) x_{j} \xi_{k} \\
& =2 x \cdot \xi+2 \sum_{j, k}\left(a_{j k}(x)-\delta_{j k}\right) x_{j} \xi_{k} \\
& \leq-2 \delta_{1}|x||\xi|+\delta_{1}|x||\xi|=-\delta_{1}|x||\xi|
\end{aligned}
$$

for $(x, \xi) \in \Omega_{R, \delta_{1}}$ where $\tilde{y}(t)=\tilde{y}(t ; x, \xi)$. Hence, in particular, $(x, \xi)$ is backward nontrapping and

$$
|\tilde{y}(t)|^{2} \geq|x|^{2}+\frac{\delta_{1}}{4}|x||t|+\varepsilon|t|^{2} \quad \text { for } t \leq 0
$$

Thus we have proved the following assertion:
Proposition 2.3. Let $0<\delta_{1}<1$. There exist $R_{0}>0$ and $\delta_{2}>0$ such that if $R \geq R_{0}$ then

$$
|\tilde{y}(t ; x, \xi)| \geq|x|+\delta_{2}|t|, \quad t \leq 0, \quad(x, \xi) \in \Omega_{R, \delta_{1}} .
$$

We note that since $k(x, \xi)$ is homogeneous in $\xi$, the flow also has the following homogeneity: for $\lambda>0$,

$$
\begin{aligned}
& \tilde{y}(t ; x, \lambda \xi)=\tilde{y}(\lambda t ; x, \xi), \\
& \tilde{\eta}(t ; x, \lambda \xi)=\lambda \tilde{\eta}(\lambda t ; x, \xi) .
\end{aligned}
$$

Thus we learn the following property concerning the high energy asymptotics of the geodesic flow:

## Proposition 2.4.

(i) Suppose $\left(x_{0}, \xi_{0}\right)$ is backward nontrapping. Then for any $t<0, \lambda>0$,

$$
\left|\tilde{y}\left(t ; x_{0}, \lambda \xi_{0}\right)\right| \geq C^{-1} \lambda|t|-C,
$$

and

$$
\xi_{-}\left(x_{0}, \xi_{0}\right)=\lim _{\lambda \rightarrow+\infty} \lambda^{-1} \tilde{\eta}\left(t ; x_{0}, \lambda \xi_{0}\right)
$$

exists. $\xi_{-}$is independent of $t<0$ which appears in the previous formula.
(ii) Let $0<\delta_{1}<1$. Then there exist $R_{0}>0$ and $\delta_{2}>0$ such that if $R \geq R_{0}$ then

$$
|\tilde{y}(t ; x, \xi)| \geq|x|+\delta_{2}|t||\xi|
$$

for $t \leq 0$ and

$$
(x, \xi) \in\left\{(x, \xi) \in \boldsymbol{R}^{2 n}\left|R-1<|x|<R+1, x \cdot \xi \leq-\delta_{1}\right| x| | \xi \mid\right\} .
$$

In particular,

$$
\xi_{-}(x, \xi)=\lim _{\lambda \rightarrow+\infty} \lambda^{-1} \tilde{\eta}(t ; x, \lambda \xi), \quad(x, \xi) \in \Omega_{R, \delta_{1}}
$$

converges uniformly in $\Omega_{R, \delta_{1}}$.

### 2.2. High energy asymptotics of the Hamilton flow.

Now we consider the Hamilton flow:

$$
(y(t ; x, \xi), \eta(t ; x, \xi))=\exp t H_{p}(x, \xi)
$$

We recall $(y(t), \eta(t))$ satisfies the Hamilton equation:

$$
\begin{aligned}
\frac{d}{d t} y_{j}(t) & =\sum_{k=1}^{n} a_{j k}(y(t)) \eta_{k}(t) \\
\frac{d}{d t} \eta_{j}(t) & =-\frac{1}{2} \sum_{j, k=1}^{n} \frac{\partial a_{k \ell}}{\partial x_{j}}(y(t)) \eta_{k}(t) \eta_{\ell}(t)-\frac{\partial V}{\partial x_{j}}(y(t)) .
\end{aligned}
$$

At first we prepare an a priori estimate:

Proposition 2.5. Let $T>0$. Then there exists $C>0$ such that

$$
|y(t ; x, \xi)|+|\eta(t ; x, \xi)| \leq C(\langle x\rangle+\langle\xi\rangle), \quad-T \leq t \leq T .
$$

In particular, if $|x| \leq \gamma|\xi|$ with some $\gamma>0$, then

$$
|y(t ; x, \xi)| \leq C^{\prime}\langle\xi\rangle, \quad|\eta(t ; x, \xi)| \leq C^{\prime}\langle\xi\rangle
$$

for $-T \leq t \leq T$, with $C^{\prime}>0$.
Proof. We note

$$
p(x, \xi)=k(x, \xi)+V(x) \leq c_{1}\left(\langle x\rangle^{2}+\langle\xi\rangle^{2}\right)
$$

with some $c_{1}>0$. Then by the conservation of energy, we learn

$$
|\eta(t ; x, \xi)| \leq c_{2} \sqrt{k(y, \eta)}=c_{2} \sqrt{p(y, \eta)-V(y)} \leq c_{3}(\langle\xi\rangle+\langle y\rangle) .
$$

Hence we have

$$
\left|\frac{d}{d t} y(t ; x, \xi)\right| \leq c_{3}(\langle\xi\rangle+\langle y\rangle) .
$$

By using the Duhamel formula, we obtain

$$
|y(t)| \leq e^{c_{3} t}|x|+\int_{0}^{t} e^{c_{3}(t-s)} c_{3}\langle\xi\rangle d s \leq c_{4}(\langle x\rangle+\langle\xi\rangle)
$$

if $0 \leq t \leq T$. Then we also have

$$
|\eta(t)| \leq c_{3}(\langle\xi\rangle+\langle y(t)\rangle) \leq c_{5}(\langle x\rangle+\langle\xi\rangle)
$$

The case $-T \leq t \leq 0$ is similar, and we omit the detail.
If we denote

$$
\begin{aligned}
& y^{\lambda}(t ; x, \xi)=y\left(\frac{t}{\lambda} ; x, \lambda \xi\right) \\
& \eta^{\lambda}(t ; x, \xi)=\frac{1}{\lambda} \eta\left(\frac{t}{\lambda} ; x, \lambda \xi\right),
\end{aligned}
$$

for $\lambda>0$, then $\left(y^{\lambda}(t), \eta^{\lambda}(t)\right)$ satisfies

$$
\begin{aligned}
\frac{d}{d t} y_{j}^{\lambda}(t) & =\sum_{k} a_{j k}\left(y^{\lambda}\right) \eta_{k}^{\lambda} \\
\frac{d}{d t} \eta_{j}^{\lambda}(t) & =-\frac{1}{2} \sum_{k, \ell} \frac{\partial a_{k \ell}}{\partial x_{j}}\left(y^{\lambda}\right) \eta_{k}^{\lambda} \eta_{\ell}^{\lambda}-\frac{1}{\lambda^{2}} \frac{\partial V}{\partial x_{j}}\left(y^{\lambda}\right),
\end{aligned}
$$

with the initial condition: $y^{\lambda}(0)=x, \eta^{\lambda}(0)=\xi$. By the continuity of the solutions to ODE's in the coefficients, we learn

$$
y^{\lambda}(t) \rightarrow \tilde{y}(t), \quad \eta^{\lambda}(t) \rightarrow \tilde{\eta}(t) \quad \text { as } \lambda \rightarrow+\infty
$$

locally uniformly in $t \in \boldsymbol{R}$. In particular, if $(x, \xi)$ is nontrapping, then for any $R>0,\left|y^{\lambda}(t)\right|>R$ for $t \ll 0$ and $\lambda \gg 0$. In fact, we have the following stronger assertion:

Proposition 2.6. Suppose $(x, \xi)$ is backward nontrapping, and let $t_{0}<0$. Then there exist $C>0$ and $\lambda_{0}>0$ such that

$$
\left|y^{\lambda}(t)\right| \geq C^{-1}|t|-C, \quad \text { for } \quad \lambda t_{0} \leq t \leq 0, \lambda \geq \lambda_{0}
$$

where $y^{\lambda}(t)=y^{\lambda}(t ; x, \xi)$. Moreover, $C$ can be taken locally uniformly with respect to $(x, \xi)$.

Proof. The proof is analogous to that of Proposition 2.1. By Proposition 2.5 , we have

$$
\left|y^{\lambda}(t)\right| \leq \alpha \lambda|\xi| \quad \text { for } \lambda t_{0} \leq t \leq 0
$$

if $\lambda$ is sufficiently large (so that $|x| \leq \beta \lambda|\xi|$ ). As in the proof of Proposition 2.1, we have

$$
\frac{d^{2}}{d t^{2}}\left|y^{\lambda}(t)\right|^{2}=4 p^{\lambda}\left(y^{\lambda}(t), \eta^{\lambda}(t)\right)+U\left(y^{\lambda}(t), \eta^{\lambda}(t)\right)
$$

where

$$
p^{\lambda}(x, \xi)=\frac{1}{2} \sum_{j, k=1}^{n} a_{j k}(x) \xi_{j} \xi_{k}+\frac{1}{\lambda^{2}} V(x),
$$

$$
U(x, \xi)=\tilde{U}(x, \xi)-\frac{4}{\lambda^{2}} V(x)-\frac{2}{\lambda^{2}} \sum_{j, k} a_{j k}(x) x_{j} \frac{\partial V}{\partial x_{k}}(x)
$$

These imply

$$
\frac{d^{2}}{d t^{2}}\left|y^{\lambda}(t)\right|^{2} \geq 4 k(x, \xi)-C \lambda^{-\mu}-C\left\langle y^{\lambda}(t)\right\rangle^{-\mu}
$$

Then, by noting the above remark that $y^{\lambda}(t) \rightarrow \tilde{y}(t)$ as $\lambda \rightarrow+\infty$, the same argument as in the proof of Proposition 2.1 applies, and we conclude the assertion.

Corollary 2.7. Let $(x, \xi), t_{0}, C$ and $\lambda_{0}$ be as in Proposition 2.6. Then

$$
|y(t ; x, \lambda \xi)| \geq C^{-1} \lambda|t|-C \quad \text { for } t_{0} \leq t \leq 0, \lambda \geq \lambda_{0}
$$

As well as Proposition 2.4, we also have the following proposition:
Proposition 2.8. Let $0<\delta_{1}<1$ and $t_{0}<0$. Then there exist $R_{0}>0$, $\delta_{2}>0$ and $\lambda_{0}>0$ such that if $R \geq R_{0}$ then

$$
|y(t ; x, \xi)| \geq|x|+\delta_{2}|t||\xi|, \quad t_{0} \leq t \leq 0
$$

for $(x, \xi) \in\left\{(x, \xi)\left|R-1<|x|<R+1,|\xi| \geq \lambda_{0} R, x \cdot \xi \leq-\delta_{1}\right| x||\xi|\}\right.$.
Proposition 2.9. Suppose $(x, \xi)$ is backward nontrapping. Then for any $t_{0}<0$, there exists $C>0$ such that

$$
\begin{aligned}
& |\eta(t ; x, \lambda \xi)-\tilde{\eta}(t ; x, \lambda \xi)| \leq C \lambda^{1-\mu}|t|^{2-\mu} \\
& |y(t ; x, \lambda \xi)-\tilde{y}(t ; x, \lambda \xi)| \leq C \lambda^{1-\mu}|t|^{3-\mu}
\end{aligned}
$$

for $t \in\left[t_{0},-1 / \lambda\right]$ and $\lambda>1$.
Proof. It suffices to show the equivalent assertion:

$$
\begin{aligned}
& \left|\eta^{\lambda}(t ; x, \xi)-\tilde{\eta}(t ; x, \xi)\right| \leq C \lambda^{-2}|t|^{2-\mu}, \\
& \left|y^{\lambda}(t ; x, \xi)-\tilde{y}(t ; x, \xi)\right| \leq C \lambda^{-2}|t|^{3-\mu}
\end{aligned}
$$

for $t \in\left[\lambda t_{0},-1\right]$. By the Hamilton equation, we have

$$
\begin{aligned}
\frac{d}{d t}\left(\eta_{j}^{\lambda}(t)-\tilde{\eta}_{j}\right) & =-\frac{1}{2} \sum_{k, \ell}\left(\frac{\partial a_{k \ell}}{\partial x_{j}}\left(y^{\lambda}\right) \eta_{k}^{\lambda} \eta_{\ell}^{\lambda}-\frac{\partial a_{k \ell}}{\partial x_{j}}(\tilde{y}) \tilde{\eta}_{k} \tilde{\eta}_{\ell}\right)-\frac{1}{\lambda^{2}} \frac{\partial V}{\partial x_{j}}\left(y^{\lambda}\right), \\
\frac{d}{d t}\left(y_{j}^{\lambda}(t)-\tilde{y}_{j}(t)\right) & =\sum_{k}\left(a_{j k}\left(y^{\lambda}\right) \eta_{k}^{\lambda}-a_{j k}(\tilde{y}) \tilde{\eta}_{k}\right)
\end{aligned}
$$

These imply

$$
\begin{aligned}
& \left|\frac{d}{d t}\left(\eta^{\lambda}-\tilde{\eta}\right)\right| \leq c_{1}\left(|t|^{-1-\mu}\left|\eta^{\lambda}-\tilde{\eta}\right|+|t|^{-2-\mu}\left|y^{\lambda}-\tilde{y}\right|+\lambda^{-2}|t|^{1-\mu}\right), \\
& \left|\frac{d}{d t}\left(y^{\lambda}-\tilde{y}\right)\right| \leq c_{1}\left|\eta^{\lambda}-\tilde{\eta}\right|+c_{1}|t|^{-1-\mu}\left|y^{\lambda}-\tilde{y}\right|
\end{aligned}
$$

for $t \leq-1$ with some $c_{1}>0$ (cf. Lemma A. 1 in Appendix). If $t \leq-T<0$, we have

$$
\begin{aligned}
& \left|\frac{d}{d t}\left(\eta^{\lambda}-\tilde{\eta}\right)\right| \leq c_{1}\left(T^{-\mu}|t|^{-1}\left|\eta^{\lambda}-\tilde{\eta}\right|+T^{-\mu}|t|^{-2}\left|y^{\lambda}-\tilde{y}\right|+\lambda^{-2}|t|^{1-\mu}\right) \\
& \left|\frac{d}{d t}\left(y^{\lambda}-\tilde{y}\right)\right| \leq c_{1}\left|\eta^{\lambda}-\tilde{\eta}\right|+c_{1} T^{-\mu}|t|^{-1}\left|y^{\lambda}-\tilde{y}\right|
\end{aligned}
$$

Thus, for $t<-T,\left|\eta^{\lambda}-\tilde{\eta}\right|$ and $\left|y^{\lambda}-\tilde{y}\right|$ are majorized by a solution to

$$
\begin{aligned}
& -Z^{\prime} \geq c_{1}\left(T^{-\mu}|t|^{-1} Z+T^{-\mu}|t|^{-2} Y+\lambda^{-2}|t|^{1-\mu}\right) \\
& -Y^{\prime} \geq Z+c_{1} T^{-\mu}|t|^{-1} Y
\end{aligned}
$$

with

$$
Z(-T) \geq\left|\eta^{\lambda}(-T)-\tilde{\eta}(-T)\right|, \quad Y(-T) \geq\left|y^{\lambda}(-T)-\tilde{y}(-T)\right|
$$

If we set

$$
Y(t)=c_{2} \lambda^{-2}|t|^{3-\mu}, \quad Z(t)=c_{3} \lambda^{-2}|t|^{2-\mu},
$$

then the differential inequalities are satisfied if

$$
\begin{aligned}
& c_{3}(2-\mu) \geq c_{1}\left(c_{3} T^{-\mu}+c_{2} T^{-\mu}+1\right) \\
& c_{2}(3-\mu) \geq c_{1} c_{3}+c_{1} c_{2} T^{-\mu} .
\end{aligned}
$$

In other words, if

$$
\begin{aligned}
& c_{3}\left((2-\mu)-c_{1} T^{-\mu}\right) \geq c_{1} c_{2} T^{-\mu}+c_{1} \\
& c_{2}\left((3-\mu)-c_{1} T^{-\mu}\right) \geq c_{1} c_{3} .
\end{aligned}
$$

We choose $T$ so large that

$$
\left((2-\mu)-c_{1} T^{-\mu}\right)^{-1} \times c_{1}^{2} T^{-\mu}\left((3-\mu)-c_{1} T^{-\mu}\right)^{-1}<1
$$

and set $c_{3}=\left((3-\mu)-c_{1} T^{-\mu}\right) c_{1}^{-1} c_{2}$. If $c_{2}$ is sufficiently large, the above inequalities are satisfied.

Since $\left|y^{\lambda}(-T)-\tilde{y}(-T)\right|,\left|\eta^{\lambda}(-T)-\tilde{\eta}(-T)\right|=O\left(\lambda^{-2}\right)$ as $\lambda \rightarrow+\infty$, the initial condition is also satisfied if $c_{2}$ is taken sufficiently large. Thus we conclude the assertion for $t \in\left[\lambda t_{0},-T\right]$. The estimate for $t \in[-T,-1]$ is obvious.

Proposition 2.9 together with Proposition 2.2 implies, in particular,

$$
\lim _{\lambda \rightarrow+\infty} \lambda^{-1} \eta(t ; x, \lambda \xi)=\lim _{\lambda \rightarrow+\infty} \lambda^{-1} \tilde{\eta}(t ; x, \lambda \xi)=\xi_{-}(x, \xi)
$$

### 2.3. Construction of a solution to the Hamilton-Jacobi equation.

In order to construct a solution to the momentum space Hamilton-Jacobi equation, we prepare one more lemma about the classical flow:

Proposition 2.10. Let $\delta_{1}>0$ and $t_{0}<0$. There exist $R_{0}>0, c_{0}>0$ and $C>0$ such that

$$
\begin{aligned}
\left|\frac{\partial}{\partial x} \eta(t ; x, \xi)\right| & \leq C R^{-1-\mu}|\xi| \\
\left|\frac{\partial}{\partial \xi}(\eta(t ; x, \xi)-\xi)\right| & \leq C R^{-\mu}
\end{aligned}
$$

for $t_{0} \leq t \leq 0$,

$$
(x, \xi) \in \Omega:=\left\{(x, \xi) \in \boldsymbol{R}^{2 n}| ||x|-R\left|\leq 1,|\xi| \geq \lambda, x \cdot \xi \leq-\delta_{1}\right| x|\cdot| \xi \mid\right\}
$$

with $R \geq R_{0}$ and $\lambda \geq c_{0} R$. Moreover, for any $\alpha, \beta \in \boldsymbol{Z}_{+}^{n}$, there is $C_{\alpha \beta}>0$ such that

$$
\begin{aligned}
&\left|\left(\frac{\partial}{\partial x}\right)^{\alpha}\left(\frac{\partial}{\partial \xi}\right)^{\beta}(y(t ; x, \xi)-x)\right| \leq C_{\alpha \beta}|t|\langle\xi\rangle^{1-|\beta|} \\
&\left|\left(\frac{\partial}{\partial x}\right)^{\alpha}\left(\frac{\partial}{\partial \xi}\right)^{\beta}(\eta(t ; x, \xi)-\xi)\right| \leq C_{\alpha \beta}\langle\xi\rangle^{1-|\beta|}
\end{aligned}
$$

for $(x, \xi) \in \Omega$ and $t \in\left[t_{0}, 0\right]$.
Proof. We set $\lambda=|\xi|$ and consider

$$
\begin{aligned}
y^{\lambda}(t ; x, \xi) & =y\left(\frac{t}{\lambda} ; x, \lambda \xi\right) \\
\eta^{\lambda}(t ; x, \xi) & =\frac{1}{\lambda} \eta\left(\frac{t}{\lambda} ; x, \lambda \xi\right)
\end{aligned}
$$

Then it suffices to show the above estimates for $\eta^{\lambda}$ and $y^{\lambda}$ with $|\xi|=1$, $\lambda \geq c_{0} R$ and $t \in\left[\lambda t_{0}, 0\right]$.

We mimic the argument of Hörmander [9] Lemma 3.7. Let $s$ denote the variable $x_{j}$ or $\xi_{j}, j=1, \ldots, n$. By the Hamilton equation, we have

$$
\begin{align*}
\frac{d}{d t}\left(\frac{\partial y_{j}^{\lambda}}{\partial s}\right)= & \sum_{k, \ell} \frac{\partial a_{j k}}{\partial x_{\ell}}\left(y^{\lambda}\right) \frac{\partial y_{\ell}^{\lambda}}{\partial s} \eta_{k}^{\lambda}+\sum_{k} a_{j k}\left(y^{\lambda}\right) \frac{\partial \eta_{k}^{\lambda}}{\partial s}  \tag{2.1}\\
\frac{d}{d t}\left(\frac{\partial \eta_{j}^{\lambda}}{\partial s}\right)= & -\frac{1}{2} \sum_{k, \ell, m} \frac{\partial^{2} a_{k \ell}}{\partial x_{j} \partial x_{m}}\left(y^{\lambda}\right) \eta_{k}^{\lambda} \eta_{\ell}^{\lambda} \frac{\partial y_{m}^{\lambda}}{\partial s} \\
& -\sum_{k, \ell} \frac{\partial a_{k \ell}}{\partial x_{j}}\left(y^{\lambda}\right) \eta_{k}^{\lambda} \frac{\partial \eta_{\ell}^{\lambda}}{\partial s}-\frac{1}{\lambda^{2}} \sum_{k} \frac{\partial^{2} V}{\partial x_{k} \partial x_{j}}\left(y^{\lambda}\right) \frac{\partial y_{k}^{\lambda}}{\partial s} \tag{2.2}
\end{align*}
$$

Then $\left|\partial y^{\lambda} / \partial s\right|$ and $\left|\partial \eta^{\lambda} / \partial s\right|$ are majorized by the solution to

$$
\begin{aligned}
& -\frac{d}{d t} Y \geq c_{1}(R+\delta|t|)^{-1-\mu} Y+c_{1} Z \\
& -\frac{d}{d t} Z \geq c_{1}(R+\delta|t|)^{-2-\mu} Y+c_{1}(R+\delta|t|)^{-1-\mu} Z+\frac{c_{1}}{\lambda^{2}}(R+\delta|t|)^{-\mu} Y,
\end{aligned}
$$

with $Y(0) \geq 0$ and $Z(0) \geq 1$ if $s=\xi_{j}, Y(0) \geq 1$ and $Z(0) \geq 0$ if $s=x_{j}$. Here we suppose $R \geq R_{0}$ and $\delta=\delta_{2}$ in Proposition 2.8. Note we consider the inequality in $t<0$.

We set

$$
Y=c_{2}(R-\delta t), \quad Z=c_{3}\left(1-(R-\delta t)^{-\mu^{\prime}}\right), \quad \lambda t_{0} \leq t \leq 0
$$

with $0<\mu^{\prime}<\mu$. Then the differential inequalities for the majorants are satisfied if

$$
\begin{align*}
c_{2} \delta & \geq c_{1} c_{2} R^{-\mu}+c_{1} c_{3}  \tag{2.3}\\
c_{3} \delta \mu^{\prime} & \geq R^{-\left(\mu-\mu^{\prime}\right)}\left(c_{1} c_{2}+c_{1} c_{3}+c_{1} c_{2}\left(\frac{R-\delta \lambda t_{0}}{\lambda}\right)^{2}\right) \tag{2.4}
\end{align*}
$$

and $R^{-\mu^{\prime}} \leq 1 / 2$ so that $Z>0$. We note

$$
\left|\frac{R-\delta \lambda t_{0}}{\lambda}\right|=\left|\frac{R}{\lambda}-\delta t_{0}\right| \leq c_{0}^{-1}+\delta\left|t_{0}\right|
$$

since $\lambda>c_{0} R$. Now we choose $c_{2} / c_{3}=\gamma>2 c_{1} / \delta$, and choose $R_{0}$ so that

$$
R_{0}>\max \left\{2^{1 / \mu^{\prime}},\left(\frac{2 c_{1}}{\delta}\right)^{1 / \mu},\left(\frac{\gamma c_{1}}{\delta \mu^{\prime}}\left[1+\gamma^{-1}+\left(c_{0}^{-1}+\delta\left|t_{0}\right|\right)^{2}\right]\right)^{1 /\left(\mu-\mu^{\prime}\right)}\right\}
$$

then the above conditions are satisfied. Thus we learn

$$
\left|\frac{\partial y_{j}^{\lambda}}{\partial s}(t)\right| \leq c_{2}(R-\delta t), \quad\left|\frac{\partial \eta_{j}^{\lambda}}{\partial s}(t)\right| \leq \frac{c_{2}}{\gamma},
$$

for $R \geq R_{0}, \lambda \geq c_{0} R$ and $t \in\left[\lambda t_{0}, 0\right]$, provided

$$
\left|\frac{\partial y_{j}^{\lambda}}{\partial s}(0)\right| \leq c_{2} R, \quad\left|\frac{\partial \eta_{j}^{\lambda}}{\partial s}(0)\right| \leq \frac{c_{2}}{2 \gamma}
$$

We now consider the case $s=x_{k}$. Then we may set $c_{2}=R^{-1}$ and we have

$$
\left|\frac{\partial y_{j}^{\lambda}}{\partial x_{k}}(t)\right| \leq 1-\frac{\delta t}{R}, \quad\left|\frac{\partial \eta_{j}^{\lambda}}{\partial x_{k}}(t)\right| \leq \frac{1}{\gamma R} .
$$

We integrate the equation (2.2) again to obtain

$$
\begin{aligned}
\left|\frac{\partial \eta_{j}^{\lambda}}{\partial x_{k}}(t)\right| \leq & \frac{c_{1}}{R} \int_{t}^{0}(R-\delta r)^{-1-\mu} d r+\frac{c_{1}}{\gamma R} \int_{t}^{0}(R-\delta r)^{-1-\mu} d r \\
& +\frac{c_{1}}{R \lambda^{2}} \int_{t}^{0}(R-\delta r)^{1-\mu} d r \\
\leq & \frac{1}{\delta}\left(\frac{c_{1}}{\mu}+\frac{c_{1}}{\gamma \mu}\right) R^{-1-\mu}+\frac{c_{1}}{\delta}\left(\frac{R-\delta t}{\lambda}\right)^{2} R^{-1-\mu} \\
\leq & C R^{-1-\mu}
\end{aligned}
$$

if $t \in\left[\lambda t_{0}, 0\right]$ and $\lambda \geq c_{0} R$. Similarly, if $s=\xi_{k}$, we may set $c_{2}=2 \gamma$ and we have

$$
\left|\frac{\partial y_{j}^{\lambda}}{\partial \xi_{k}}(t)\right| \leq 2 \gamma(R-\delta t), \quad\left|\frac{\partial \eta_{j}^{\lambda}}{\partial \xi_{k}}(t)\right| \leq 2 .
$$

By integrating the equation (2.2), we conclude

$$
\left|\frac{\partial \eta_{j}^{\lambda}}{\partial \xi_{k}}(t)-\delta_{j k}\right| \leq C^{\prime} R^{-\mu}
$$

For higher derivatives, we prove the estimates by induction. It suffices to show

$$
\begin{aligned}
&\left|\partial_{x}^{\alpha} \partial_{\xi}^{\beta}\left(y^{\lambda}(t ; x, \xi)-x\right)\right| \leq C_{\alpha \beta}|t|, \\
&\left|\partial_{x}^{\alpha} \partial_{\xi}^{\beta}\left(\eta^{\lambda}(t ; x, \xi)-\xi\right)\right| \leq C_{\alpha \beta}
\end{aligned}
$$

for $t \in\left[\lambda t_{0}, 0\right]$. We suppose these hold for $|\alpha+\beta|<k$, and let

$$
Y(t)=\partial_{x}^{\alpha} \partial_{\xi}^{\beta}\left(y^{\lambda}(t ; x, \xi)-x\right), \quad Z(t)=\partial_{x}^{\alpha} \partial_{\xi}^{\beta}\left(\eta^{\lambda}(t ; x, \xi)-\xi\right)
$$

with $|\alpha+\beta|=k$. Then by the induction hypothesis, we can show $Y$ and $Z$ satisfy

$$
\begin{aligned}
Y^{\prime} & =A_{11} Y+A_{12} Z+A_{13}, \\
Z^{\prime} & =A_{21} Y+A_{22} Z+A_{23}+\lambda^{-2}\left(A_{31} Y+A_{33}\right), \\
Y(0) & =Z(0)=0,
\end{aligned}
$$

where

$$
\begin{array}{lll}
A_{11}=O\left(\langle t\rangle^{-1-\mu}\right), & A_{12}=O(1), & A_{13}=O\left(\langle t\rangle^{-\mu}\right), \\
A_{21}=O\left(\langle t\rangle^{-2-\mu}\right), & A_{22}=O\left(\langle t\rangle^{-1-\mu}\right), & A_{23}=O\left(\langle t\rangle^{-1-\mu}\right), \\
A_{31}=O\left(\langle t\rangle^{-\mu}\right), & A_{32}=O\left(\langle t\rangle^{1-\mu}\right), &
\end{array}
$$

which itself is proved by induction. Then for $t \in\left[\lambda t_{0},-1\right]$, we have

$$
\begin{aligned}
\left|Y^{\prime}\right| & \leq c_{1}\left(\langle t\rangle^{-1-\mu}|Y|+|Z|+\langle t\rangle^{-\mu}\right) \\
\left|Z^{\prime}\right| & \leq c_{1}\left(\langle t\rangle^{-2-\mu}|Y|+\langle t\rangle^{-1-\mu}|Z|+\langle t\rangle^{-1-\mu}\right)
\end{aligned}
$$

These imply $Y$ and $Z$ are majorized by $M\langle t\rangle$ and $M$, respectively, with sufficiently large $M$ (the proof is analogous to the above argument). By integrating the differential equation again, we conclude the assertion for $|\alpha+\beta|=k$.

We note the above proof for the derivatives works for $(\tilde{y}(t ; x, \xi), \tilde{\eta}(t ; x, \xi))(t<$ $0)$ if $(x, \xi)$ is backward nontrapping. In particular, we learn that $\partial_{t} \partial_{x}^{\alpha} \partial_{\xi}^{\beta} \tilde{\eta}(t ; x, \xi)$ is integrable with respect to $t$ in $(-\infty, 0]$, and hence we conclude $\partial_{x}^{\alpha} \partial_{\xi}^{\beta} \tilde{\eta}(t ; x, \xi)$ converges as $t \rightarrow-\infty$, and the estimate is locally uniform. Thus we have

Corollary 2.11. Suppose $(x, \xi)$ is backward nontrapping. Then

$$
(x, \xi) \mapsto \xi_{-}(x, \xi)
$$

is a $C^{\infty}$ map, and $\tilde{\eta}(t ; x, \xi)$ converges to $\xi_{-}(x, \xi)$ locally uniformly with all the derivatives as $t \rightarrow-\infty$.

Now we consider for $t_{0} \leq t \leq 0$ the map:

$$
\Lambda: \xi \longmapsto \eta\left(t ;-R \frac{\xi}{|\xi|}, \xi\right) .
$$

Proposition 2.10 implies $\left\|\frac{\partial \Lambda}{\partial \xi}-I\right\|=O\left(R^{-\mu}\right)$ uniformly for $|\xi| \geq c_{0} R$. We choose $R$ so large that $\frac{\partial \Lambda}{\partial \xi}$ is invertible for $|\xi| \geq c_{0} R$. It is also easy to see that $|\Lambda-\xi|=$ $O\left(R^{-\mu}|\xi|\right)$ for $|\xi| \geq c_{0} R$, and hence $\operatorname{Ran} \Lambda \supset\left\{\xi \in \boldsymbol{R}^{n}| | \xi \mid \geq c_{4} R\right\}$ with some $c_{4}>0$. Then we set

$$
\zeta(t, \cdot)=\Lambda(t, \cdot)^{-1}:\left\{\xi| | \xi \mid \geq c_{4} R\right\} \longrightarrow \boldsymbol{R}^{n}
$$

i.e.,

$$
\eta\left(t ;-R \frac{\zeta(t, \xi)}{|\zeta(t, \xi)|} \zeta(t, \xi)\right)=\xi \quad \text { for }|\xi| \geq c_{4} R
$$

By Proposition 2.10, we learn

$$
\begin{equation*}
\left|\left(\frac{\partial}{\partial \xi}\right)^{\alpha} \zeta(t, \xi)\right| \leq C_{\alpha}\langle\xi\rangle^{1-|\alpha|}, \quad t \in\left[t_{0}, 0\right],|\xi| \geq c_{4} R \tag{2.5}
\end{equation*}
$$

Then we set

$$
W_{1}(t, \xi)=\int_{0}^{t} p(y(s, \xi), \xi) d s-R|\xi|, \quad|\xi| \geq c_{4} R
$$

where

$$
y(s, \xi)=y\left(s ;-R \frac{\xi}{|\xi|}, \zeta(s ; \xi)\right) .
$$

It is well-known that $W_{1}(t, \xi)$ satisfies the Hamilton-Jacobi equation (cf. ReedSimon [18], Section XI.9):

$$
\frac{\partial}{\partial t} W_{1}(t, \xi)=p\left(\frac{\partial W_{1}}{\partial \xi}(t, \xi), \xi\right), \quad|\xi| \geq c_{4} R
$$

By the construction we have

$$
\partial_{\xi} W_{1}(t, \xi)=y\left(t ;-R \frac{\zeta(t, \xi)}{|\zeta(t, \xi)|}, \zeta(t ; \xi)\right)
$$

and

$$
\begin{equation*}
\left|\partial_{\xi}^{\alpha} W_{1}(t, \xi)\right| \leq C_{\alpha}\langle\xi\rangle^{2-|\alpha|}, \quad t \in\left[t_{0}, 0\right],|\xi| \geq c_{4} R \tag{2.6}
\end{equation*}
$$

We use a partition of unity to construct $W(t, \xi)$ so that

$$
W(t, \xi)= \begin{cases}W_{1}(t, \xi), & |\xi| \geq c_{4} R+1 \\ -R|\xi|+\frac{t|\xi|^{2}}{2}, & |\xi| \leq c_{4} R\end{cases}
$$

Clearly $W$ satisfies (2.6) as well.

### 2.4. Modified free motion and asymptotic trajectories.

Proposition 2.12. Suppose ( $x_{0}, \xi_{0}$ ) is backward nontrapping, and let $t_{0}<$ 0 . Then there exists a neighborhood $U$ of $\left(x_{0}, \xi_{0}\right)$ in $\boldsymbol{R}^{2 n}$ such that

$$
\begin{aligned}
& \xi_{-}(x, \xi)=\lim _{\lambda \rightarrow+\infty} \lambda^{-1} \eta\left(t_{0} ; x, \lambda \xi\right) \\
& z_{-}(x, \xi)=\lim _{\lambda \rightarrow+\infty}\left\{y\left(t_{0} ; x, \lambda \xi\right)-\partial_{\xi} W\left(t_{0}, \eta\left(t_{0} ; x, \lambda \xi\right)\right)\right\}
\end{aligned}
$$

exist for $(x, \xi) \in U . \xi_{-}(x, \xi)$ and $z_{-}(x, \xi)$ are independent of $t_{0}<0$. Moreover, the convergence is uniform in $U$ with its derivatives, and

$$
S_{-}:(x, \xi) \mapsto\left(z_{-}, \xi_{-}\right)
$$

is a local diffeomorphism.
Remark 2.13. We have already seen $\xi_{-}$depends only on $\left(a_{j k}(x)\right)$, and is independent of $V(x)$. As we will see in the proof, $z_{-}$is also independent of $V(x)$, though $W(t, \xi)$ does depend on $V(x)$.

Proof. The convergence of $\xi_{-}$is already shown in Proposition 2.9 and its remark. At first, we show

$$
z^{\lambda}(t ; x, \xi)=y^{\lambda}(t ; x, \xi)-\partial_{\xi} W^{\lambda}\left(t ; \eta^{\lambda}(t ; x, \xi)\right)
$$

converges as $\lambda \rightarrow \infty$, where $W^{\lambda}(t, \xi)=\lambda^{-1} W(t / \lambda, \lambda \xi)$ and $t=\lambda t_{0}$.
For $(x, \xi)$ near $\left(x_{0}, \xi_{0}\right)$, we choose $\zeta^{\lambda} \in \boldsymbol{R}^{n}$ such that

$$
\eta^{\lambda}(t ; x, \xi)=\eta^{\lambda}\left(t ;-R \frac{\zeta^{\lambda}}{\left|\zeta^{\lambda}\right|}, \zeta^{\lambda}\right)
$$

and we set

$$
v^{\lambda}(s)=y^{\lambda}\left(s ;-R \frac{\zeta^{\lambda}}{\left|\zeta^{\lambda}\right|}, \zeta^{\lambda}\right), \quad w^{\lambda}(s)=\eta^{\lambda}\left(s ;-R \frac{\zeta^{\lambda}}{\left|\zeta^{\lambda}\right|}, \zeta^{\lambda}\right)
$$

for $s \in[t, 0]$. Note that $\zeta^{\lambda}$ is a function of $x, \xi$ and $t=\lambda t_{0}$, and $\partial_{x} \partial_{\xi} \zeta^{\lambda}$ is uniformly bounded by virtue of Proposition 2.10 and discussion after it. We also set

$$
\begin{aligned}
& a(s)=y^{\lambda}(s ; x, \xi)-v^{\lambda}(s) \\
& b(s)=\eta^{\lambda}(s ; x, \xi)-w^{\lambda}(s)
\end{aligned}
$$

We note

$$
|a(0)|=\left|x+R \frac{\zeta}{|\zeta|}\right| \leq|x|+R, \quad b(t)=0
$$

$a$ and $b$ satisfy differential equations:

$$
\begin{aligned}
\frac{d}{d s} a(s) & =\frac{\partial p^{\lambda}}{\partial \xi}\left(y^{\lambda}, \eta^{\lambda}\right)-\frac{\partial p^{\lambda}}{\partial \xi}\left(v^{\lambda}, w^{\lambda}\right) \\
\frac{d}{d s} b(s) & =-\left(\frac{\partial p^{\lambda}}{\partial x}\left(y^{\lambda}, \eta^{\lambda}\right)-\frac{\partial p^{\lambda}}{\partial x}\left(v^{\lambda}, w^{\lambda}\right)\right)
\end{aligned}
$$

where $p^{\lambda}(x, \xi)=\frac{1}{2} \sum_{j, k} a_{j k}(x) \xi_{j} \xi_{k}+\lambda^{-2} V(x)$. Since $\lambda \geq\left|s / t_{0}\right|$, these imply

$$
\begin{align*}
\left|a^{\prime}(s)\right| & \leq c_{1}\langle s\rangle^{-1-\mu}|a(s)|+c_{1}|b(s)|  \tag{2.7}\\
\left|b^{\prime}(s)\right| & \leq c_{1}\langle s\rangle^{-2-\mu}|a(s)|+c_{1}\langle s\rangle^{-1-\mu}|b(s)| \tag{2.8}
\end{align*}
$$

for $s \in[t, 0]$ with some $c_{1}>0$. We note $a(s)=O(\langle s\rangle)$ and $b(s)=O(1)$ by Proposition 2.5. Hence by (2.8), we have

$$
|b(s)|=\left|\int_{t}^{s} b^{\prime}(u) d u\right| \leq c_{2}\langle s\rangle^{-\mu}=O\left(\langle s\rangle^{-\mu}\right) .
$$

Then we substitute this to (2.7) to obtain

$$
|a(s)|=\left|a(0)-\int_{s}^{0} a^{\prime}(u) d u\right| \leq|x|+R+c_{3}\langle s\rangle^{1-\mu}=O\left(\langle s\rangle^{1-\mu}\right) .
$$

Repeating these, we have $|b(s)|=O\left(\langle s\rangle^{-2 \mu}\right)$ and then $|a(s)|=O\left(\langle s\rangle^{1-2 \mu}\right)$ provided $2 \mu \leq 1$. Iterating this procedure, we arrive at $|a(s)| \leq C$ and $|b(s)| \leq C\langle s\rangle^{-1-\mu}$. Moreover, we also have

$$
\left|a^{\prime}(s)\right| \leq c_{4}\langle s\rangle^{-1-\mu}
$$

We recall that $y^{\lambda}(s ; x, \xi) \rightarrow \tilde{y}(s ; x, \xi)$ as $\lambda \rightarrow \infty$ for each $s$, and $\eta^{\lambda}(t ; x, \xi)$ converges to $\xi_{-}(x, \xi)$ as $\lambda \rightarrow \infty$ since $t=\lambda t_{0} \underset{\sim}{\text { with }} t_{0}<0$. By the uniform continuity of the inverse of $\Lambda(t, \cdot), \zeta^{\lambda}$ converges to $\tilde{\zeta}$ as $\lambda \rightarrow \infty$, where $\tilde{\zeta}$ is given by $\xi_{-}(x, \xi)=$ $\xi_{-}(-R \tilde{\zeta} /|\tilde{\zeta}|, \tilde{\zeta})$. Hence, in particular, $v^{\lambda}(s)$ converges to $\tilde{y}(s ;-R \tilde{\zeta} /|\tilde{\zeta}|, \tilde{\zeta})$ for each
$s$. Then by the dominated convergence theorem, we learn

$$
\begin{aligned}
& \lim _{\lambda \rightarrow \infty}\left\{y\left(t_{0} ; x, \lambda \xi\right)-\partial_{\xi} W\left(t_{0}, \eta\left(t_{0} ; x, \lambda \xi\right)\right)\right\}=\lim _{\lambda \rightarrow \infty}\left\{y^{\lambda}(t ; x, \xi)-v^{\lambda}(s)\right\} \\
& \quad=\lim _{\lambda \rightarrow \infty}\left[x+R \frac{\zeta^{\lambda}}{\left|\zeta^{\lambda}\right|}-\int_{t}^{0} \frac{d}{d s}\left(y^{\lambda}(s ; x, \xi)-v^{\lambda}(s)\right) d s\right] \\
& \quad=x+R \frac{\tilde{\zeta}}{|\tilde{\zeta}|}-\int_{-\infty}^{0} \frac{d}{d s}\left(\tilde{y}(s ; x, \xi)-\tilde{y}\left(s ;-R \frac{\tilde{\zeta}}{|\tilde{\zeta}|}, \tilde{\zeta}\right)\right) d s
\end{aligned}
$$

Note the right hand side is independent of the potential $V(x)$.
Next we consider the convergence of the derivatives. As in the proof of Proposition 2.10, for any $\alpha, \beta \in \boldsymbol{Z}_{+}^{n}$, we have

$$
\left|\partial_{s} \partial_{x}^{\alpha} \partial_{\xi}^{\beta} \eta^{\lambda}(s ; x, \xi)\right| \leq C\langle s\rangle^{-1-\mu}, \quad \lambda t_{0} \leq s \leq 0
$$

Hence, by the dominated convergence theorem, we have

$$
\begin{aligned}
\lambda^{-1} \partial_{x}^{\alpha} \partial_{\xi}^{\beta} \eta\left(t_{0} ; x, \lambda \xi\right) & =\partial_{x}^{\alpha} \partial_{\xi}^{\beta} \eta^{\lambda}\left(\lambda t_{0} ; x, \xi\right) \\
& =\partial_{x}^{\alpha} \partial_{\xi}^{\beta} \xi-\int_{\lambda t_{0}}^{0} \partial_{s} \partial_{x}^{\alpha} \partial_{\xi}^{\beta} \eta^{\lambda}(s ; x, \xi) d s \\
& \longrightarrow \partial_{x}^{\alpha} \partial_{\xi}^{\beta} \xi-\int_{-\infty}^{0} \partial_{s} \partial_{x}^{\alpha} \partial_{\xi}^{\beta} \tilde{\eta}(s ; x, \xi) d s=\partial_{x}^{\alpha} \partial_{\xi}^{\beta} \xi_{-}(x, \xi)
\end{aligned}
$$

as $\lambda \rightarrow \infty$ (cf. Corollary 2.11).
For $z(t ; x, \xi)$, we prove the convergence by induction. Let $a(s)$ and $b(s)$ be as above, and consider $\partial_{x}^{\alpha} \partial_{\xi}^{\beta} a(s)$ and $\partial_{x}^{\alpha} \partial_{\xi}^{\beta} b(s)$. We suppose

$$
\left|\partial_{x}^{\alpha} \partial_{\xi}^{\beta} a(s)\right| \leq C, \quad\left|\partial_{x}^{\alpha} \partial_{\xi}^{\beta} b(s)\right| \leq C\langle s\rangle^{-1-\mu}, \quad s \in\left[-\lambda t_{0}, 0\right]
$$

for $|\alpha+\beta|<k$ as our induction hypothesis. Let $|\alpha+\beta|=k$, and set $A(s)=\partial_{x}^{\alpha} \partial_{\xi}^{\beta} a(s)$ and $B(s)=\partial_{x}^{\alpha} \partial_{\xi}^{\beta} b(s)$. Then by inductive computations (from the differential equation for $a(s)$ and $b(s)$ ) that we can show (as in the proof of Proposition 2.10), $A(s)$ and $B(s)$ satisfy

$$
\begin{aligned}
& \left|A^{\prime}(s)\right| \leq c_{1}\langle s\rangle^{-1-\mu}|A(s)|+c_{1}|B(s)|+c_{1}\langle s\rangle^{-1-\mu} \\
& \left|B^{\prime}(s)\right| \leq c_{1}\langle s\rangle^{-2-\mu}|A(s)|+c_{1}\langle s\rangle^{-1-\mu}|B(s)|+c_{1}\langle s\rangle^{-2-\mu}
\end{aligned}
$$

for $s \in\left[\lambda t_{0}, 0\right]$. Note we use a priori estimates: $A(s)=O(\langle s\rangle), B(s)=O(1)$, which follow from Proposition 2.10. Since $A(0)$ is bounded and $B\left(\lambda t_{0}\right)=0$, we can use the same argument as above (for $a(s)$ and $b(s)$ ) to conclude $A(s)=O(1)$ and $B(s)=O\left(\langle s\rangle^{-1-\mu}\right)$, and the induction step is proved. Moreover, we have $A^{\prime}(s)=O\left(\langle s\rangle^{-1-\mu}\right)$, and the convergence of $\partial_{x}^{\alpha} \partial_{\xi}^{\beta} z^{\lambda}(t, x, \xi)=\partial_{x}^{\alpha} \partial_{\xi}^{\beta} a(t)$ is proved similarly.

Finally, we prove that $S_{-}:(x, \xi) \mapsto\left(z_{-}, \xi_{-}\right)$is a local diffeomorphism. By the intertwining property of the classical wave operators, we have

$$
S_{-} \exp \left(T H_{p}\right)=\exp \left(T H_{p_{0}}\right) S_{-}
$$

for $T<0$, where $p_{0}=\frac{1}{2}|\xi|^{2}$ is the free Hamiltonian. If $|T|$ is sufficiently large, $\exp \left(T H_{p}\right)$ maps $(x, \xi)$ to $\left(x^{\prime}, \xi^{\prime}\right)$ such that $\left|x^{\prime}\right| \gg 0$ and $x^{\prime} \cdot \xi^{\prime}<-\delta\left|x^{\prime}\right|\left|\xi^{\prime}\right|$ with some $\delta>0$. We show $S_{-}$is diffeomorphic in a neighborhood of $\left(x^{\prime}, \xi^{\prime}\right)$ if $\left|x^{\prime}\right|$ is sufficiently large.

We use the above argument for the trajectory starting from $\left(x^{\prime}, \xi^{\prime}\right)$. Let $\varepsilon>0$ be a small constant, which we will specify later. Let $0<\mu^{\prime}<\mu$. If $\left|x^{\prime}\right|$ is sufficiently large, then $A(s)$ and $B(s)$ above (with a new initial condition) satisfy

$$
\begin{aligned}
& \left|A^{\prime}(s)\right| \leq \varepsilon c_{1}\langle s\rangle^{-1-\mu^{\prime}}|A(s)|+c_{1}|B(s)|+\varepsilon c_{1}\langle s\rangle^{-1-\mu^{\prime}}, \\
& \left|B^{\prime}(s)\right| \leq \varepsilon c_{1}\langle s\rangle^{-2-\mu^{\prime}}|A(s)|+\varepsilon c_{1}\langle s\rangle^{-1-\mu^{\prime}}|B(s)|+\varepsilon c_{1}\langle s\rangle^{-2-\mu^{\prime}}
\end{aligned}
$$

for $s \in\left[\lambda t_{0}, 0\right]$. Then, by carrying out the same argument as above, we learn $|A(t)-A(0)| \leq c_{2} \varepsilon$. In particular, since $z^{\lambda}(0)=x+R \zeta^{\lambda} /\left|\zeta^{\lambda}\right|$, we have

$$
\left|\partial_{x}\left(z^{\lambda}(t)-x\right)\right| \leq c_{3} \varepsilon, \quad\left|\partial_{\xi} z^{\lambda}(t)\right| \leq c_{3}
$$

where $t=\lambda t_{0}$. We recall, again by Proposition 2.10, we have

$$
\left|\partial_{x} \eta^{\lambda}(t)\right| \leq c_{3} \varepsilon, \quad\left|\partial_{\xi}\left(\eta^{\lambda}(t)-\xi\right)\right| \leq c_{3} \varepsilon
$$

if $\left|x^{\prime}\right|$ is sufficiently large. Now if $\varepsilon$ is sufficiently small (depending only on $c_{3}$ ),

$$
\left(x^{\prime}, \xi^{\prime}\right) \mapsto\left(z^{\lambda}(t), \eta^{\lambda}(t)\right)
$$

has the Jacobian bounded from below by, for example, $1 / 2$. We now fix $\varepsilon>0$, and choose $T$ (and hence $\left(x^{\prime}, \xi^{\prime}\right)$ ) accordingly. This Jacobian converges to that of $S_{-}$ as $\lambda \rightarrow \infty$, and hence it is bounded from below by $1 / 2$. Thus we learn that $S_{-}$is
diffeomorphic in a neighborhood of $\left(x^{\prime}, \xi^{\prime}\right)$ by the inverse function theorem. Since $\exp \left(T H_{p}\right)$ and $\exp \left(T H_{p_{0}}\right)$ are diffeomorphic, this implies $S_{-}$is diffeomorphic in a neighborhood of $(x, \xi)$.

Note the above argument works for the scattering with $\exp t H_{k}$ also. In fact, the proof is simpler by virtue of the scaling property. For example, $\left(z^{\lambda}(s), \eta^{\lambda}(s)\right)$ is independent of $\lambda$, the convergence follows immediately from the integrability of the derivative.

## 3. Proof of main theorems.

### 3.1. Asymptotic motion and solutions to transport equations.

We denote

$$
\begin{gathered}
z(t ; x, \xi)=y(t ; x, \xi)-\partial_{\xi} W(t, \eta(t ; x, \xi)), \\
z^{\lambda}(t ; x, \xi)=z\left(\frac{t}{\lambda} ; x, \lambda \xi\right), \quad \eta^{\lambda}(t ; x, \xi)=\frac{1}{\lambda} \eta\left(\frac{t}{\lambda} ; x, \lambda \xi\right),
\end{gathered}
$$

and also

$$
\begin{aligned}
S_{t} & :(x, \xi) \mapsto(z(t ; x, \xi), \eta(t ; x, \xi)), \\
S_{t}^{\lambda}: & (x, \xi) \mapsto\left(z^{\lambda}(t ; x, \xi), \eta^{\lambda}(t ; x, \xi)\right)
\end{aligned}
$$

$S_{t}$ (resp. $S_{t}^{\lambda}$ ) is the Hamilton flow generated by

$$
\ell(t ; x, \xi)=p\left(x+\partial_{\xi} W(t, \xi), \xi\right)-\partial_{t} W(t, \xi)
$$

$\left(\ell^{\lambda}(t ; x, \xi)=\lambda^{-2} \ell(t / \lambda, x, \lambda \xi)\right.$, resp.) with the initial condition:

$$
z(0 ; x, \xi)=x+R \frac{\xi}{|\xi|}, \quad \eta(0 ; x, \xi)=\xi
$$

$\left(z^{\lambda}(0 ; x, \xi)=x+R \xi /|\xi|, \eta^{\lambda}(0 ; x, \xi)=\xi\right.$, resp. $)$.
By virtue of the Hamilton-Jacobi equation, we have

$$
\ell(t ; x, \xi)=p\left(x+\partial_{\xi} W(t, \xi), \xi\right)-p\left(\partial_{\xi} W(t, \xi), \xi\right)
$$

for sufficiently large $|\xi|$.
Let $f_{0}(x, \xi)$ be a $C_{0}^{\infty}$-function supported in a small neighborhood of $\left(x_{0}+\right.$
$\left.R \xi_{0} /\left|\xi_{0}\right|, \xi_{0}\right)$. We set

$$
f_{0}^{\lambda}(x, \xi)=f_{0}\left(x, \frac{\xi}{\lambda}\right)
$$

Then the solution to

$$
\frac{\partial}{\partial t} f(t ; \cdot, \cdot)=-\{\ell, f\}, \quad \text { with } \quad f(0 ; x, \xi)=f_{0}^{\lambda}(x, \xi)
$$

is given by

$$
f(t ; x, \xi)=f_{0}^{\lambda} \circ S_{t}^{-1}(x, \xi) \quad \text { for } t \in\left[t_{0}, 0\right] .
$$

Similarly, the solution to

$$
\frac{\partial}{\partial t} f^{\lambda}(t ; \cdot, \cdot)=-\left\{\ell^{\lambda}, f^{\lambda}\right\}, \quad \text { with } \quad f^{\lambda}(0 ; x, \xi)=f_{0}(x, \xi)
$$

is given by

$$
f^{\lambda}(t ; x, \xi)=f_{0} \circ\left(S_{t}^{\lambda}\right)^{-1}(x, \xi) \quad \text { for } t \in\left[\lambda t_{0}, 0\right]
$$

It is easy to see $f^{\lambda}(t ; x, \xi)=f(t / \lambda ; x, \lambda \xi)$. By Proposition 2.12, we learn

$$
S_{-}(x, \xi)=\lim _{\lambda \rightarrow+\infty} S_{\lambda t}^{\lambda}(x, \xi)
$$

exists, and that all the derivatives converge locally uniformly (cf. the proof of Proposition 2.12). In particular, we have

$$
\begin{aligned}
f_{-}(x, \xi) & =\lim _{\lambda \rightarrow+\infty} f(t ; x, \lambda \xi)=\lim _{\lambda \rightarrow+\infty} f^{\lambda}(\lambda t ; x, \xi) \\
& =f_{0} \circ\left(S_{-}\right)^{-1}(x, \xi) \in C_{0}^{\infty}\left(\boldsymbol{R}^{2 n}\right)
\end{aligned}
$$

exists and it is independent of $t \in\left[t_{0}, 0\right)$. The convergence is locally uniform along with its derivatives.

### 3.2. Proof of Theorem 1.2.

At first we consider

$$
v(t)=e^{i W\left(t, D_{x}\right)} e^{-i t H} v_{0} \quad \text { for } t \in\left[t_{0}, 0\right]
$$

with $v_{0} \in L^{2}\left(\boldsymbol{R}^{n}\right) . v(t)$ satisfies the evolution equation:

$$
\begin{aligned}
\frac{d}{d t} v(t) & =e^{i W\left(t, D_{x}\right)}\left\{i \frac{\partial W}{\partial t}\left(t, D_{x}\right)-i H\right\} e^{-i t H} v_{0} \\
& =-i\left\{e^{i W\left(t, D_{x}\right)} H e^{-i W\left(t, D_{x}\right)}-\frac{\partial W}{\partial t}\left(t, D_{x}\right)\right\} v(t)
\end{aligned}
$$

Namely, $v(t)$ is a solution to a Schrödinger equation with the time-dependent Hamiltonian:

$$
L(t)=e^{i W\left(t, D_{x}\right)} H e^{-i W\left(t, D_{x}\right)}-\frac{\partial W}{\partial t}\left(t, D_{x}\right)
$$

The next lemma is basic in the following analysis.
Lemma 3.1. Let $\nu, \rho>0$ and suppose $a \in S\left(\langle x\rangle^{\nu}\langle\xi\rangle^{\rho}, d x^{2} /\langle x\rangle^{2}+d \xi^{2} /\langle\xi\rangle^{2}\right)$. Let

$$
Q=e^{i W\left(t, D_{x}\right)} a\left(x, D_{x}\right) e^{-i W\left(t, D_{x}\right)}
$$

Then $Q \in O P S_{K}\left(\langle t \xi\rangle^{\nu}\langle\xi\rangle^{\rho}, d x^{2} /\langle t \xi\rangle^{2}+d \xi^{2} /\langle\xi\rangle^{2}\right)$ with any $K \subset \subset \boldsymbol{R}^{n}$. Let $g(t ; x, \xi)=\sigma(Q)$ be the Weyl symbol of $Q$. Then the principal symbol of $Q$ is given by $a\left(x+\partial_{\xi} W(t, \xi), \xi\right)$ and

$$
g(t ; x, \xi)-a\left(x+\partial_{\xi} W(t, \xi), \xi\right) \in S_{K}\left(\langle t \xi\rangle^{\nu-2}\langle\xi\rangle^{\rho-2}, \frac{d x^{2}}{\langle t \xi\rangle^{2}}+\frac{d \xi^{2}}{\langle\xi\rangle^{2}}\right)
$$

where the remainder is locally bounded in $t$ with respect to the seminorms of the symbol class.

Proof. The proof is standard pseudodifferential operator calculus, but we sketch it for the completeness. Since the Weyl quantization has the same symbol representation in the Fourier space as in the configuration space, we may write

$$
\hat{A} u:=\mathscr{F}\left(a\left(x, D_{x}\right) \check{u}\right)=(2 \pi)^{-n} \iint e^{-i(\xi-\eta) \cdot x} a\left(x, \frac{\xi+\eta}{2}\right) u(\eta) d \eta d x
$$

for $u \in \mathscr{S}\left(\boldsymbol{R}^{n}\right)$. By direct computations, we have

$$
\begin{aligned}
& e^{i W(t, \xi)} \hat{A} e^{-i W(t, \xi)} u(\xi) \\
& \quad=(2 \pi)^{-n} \iint e^{i(W(t, \xi)-W(t, \eta))-i(\xi-\eta) \cdot x} a\left(x, \frac{\xi+\eta}{2}\right) u(\eta) d \eta d x \\
& \quad=(2 \pi)^{-n} \iint e^{-i(\xi-\eta) \cdot(x-\tilde{W}(t, \xi, \eta))} a\left(x, \frac{\xi+\eta}{2}\right) u(\eta) d \eta d x \\
& \quad=(2 \pi)^{-n} \iint e^{-i(\xi-\eta) \cdot x} a\left(x+\tilde{W}(t, \xi, \eta), \frac{\xi+\eta}{2}\right) u(\eta) d \eta d x,
\end{aligned}
$$

where

$$
\tilde{W}(t, \xi, \eta)=\int_{0}^{1} \partial_{\xi} W(t, s \xi+(1-s) \eta) d s
$$

We easily see

$$
\left|\partial_{\xi}^{\alpha} \partial_{\eta}^{\beta} \tilde{W}(t, \xi, \eta)\right| \leq C_{\alpha \beta}\left\langle\frac{\xi+\eta}{2}\right\rangle^{1-|\alpha+\beta|}\langle\xi-\eta\rangle^{1+|\alpha+\beta|},
$$

for any $\alpha, \beta \in Z_{+}^{n}$, and $\tilde{W}(t, \xi, \xi)=\partial_{\xi} W(t, \xi)$. Moreover, if $|\alpha| \geq 2$, by the definition of $W(t, \xi)$ and Proposition 2.10, we have

$$
\begin{equation*}
\left|\partial_{\xi}^{\alpha} W(t, \xi)\right| \leq C_{\alpha}\left(\langle\xi\rangle^{1-|\alpha|}+|t|\langle\xi\rangle^{2-|\alpha|}\right), \tag{3.1}
\end{equation*}
$$

and hence

$$
\begin{aligned}
& \left|\partial_{\xi}^{\alpha} \partial_{\eta}^{\beta} \tilde{W}(t, \xi, \eta)\right| \\
& \quad \leq C_{\alpha \beta}\left(\left\langle\frac{\xi+\eta}{2}\right\rangle^{-|\alpha+\beta|}\langle\xi-\eta\rangle^{|\alpha+\beta|}+|t|\left\langle\frac{\xi+\eta}{2}\right\rangle^{1-|\alpha+\beta|}\langle\xi-\eta\rangle^{1+|\alpha+\beta|}\right) \\
& \quad \leq C_{\alpha \beta}\left\langle t\left(\frac{\xi+\eta}{2}\right)\right\rangle\left\langle\frac{\xi+\eta}{2}\right\rangle^{-|\alpha+\beta|}\langle\xi-\eta\rangle^{1+|\alpha+\beta|}
\end{aligned}
$$

if $\alpha+\beta \neq 0$. We also note

$$
|\tilde{W}(t, \xi, \eta)| \geq \delta\langle | t\left|\frac{\xi+\eta}{2}\right\rangle \quad \text { if } \xi \cdot \eta \geq \frac{1}{2}|\xi||\eta|
$$

with some $\delta>0$. If $\xi \cdot \eta \leq \frac{1}{2}|\xi||\eta|$, we have $|\xi+\eta|^{2} \leq 3|\xi-\eta|^{2}$, and hence

$$
\left|\partial_{\xi}^{\alpha} \partial_{\eta}^{\beta} \tilde{W}(t, \xi, \eta)\right| \leq C_{\alpha \beta} \leq C_{\alpha \beta}^{\prime}\left\langle\frac{\xi+\eta}{2}\right\rangle^{-|\alpha+\beta|}\langle\xi-\eta\rangle^{|\alpha+\beta|}
$$

where $\alpha+\beta \neq 0$. Combining these, we can show

$$
\begin{aligned}
& \left|\partial_{x}^{\alpha} \partial_{\xi}^{\beta} \partial_{\eta}^{\gamma} a\left(x+\tilde{W}(t, \xi, \eta), \frac{\xi+\eta}{2}\right)\right| \\
& \quad \leq C_{\alpha \beta \gamma}\left\langle t\left(\frac{\xi+\eta}{2}\right)\right\rangle^{\nu-|\alpha|}\left\langle\frac{\xi+\eta}{2}\right\rangle^{\rho-|\beta+\gamma|}\langle\xi-\eta\rangle^{|\nu|+|\rho|+|\alpha+\beta+\gamma|}
\end{aligned}
$$

for $x \in K \subset \subset \boldsymbol{R}^{n}$ and $\xi, \eta \in \boldsymbol{R}^{n}$. Then by the asymptotic expansion formula for the simplified symbol, we learn that the principal symbol is given by $a(x+$ $\left.\partial_{\xi} W(t, \xi), \xi\right)$. Moreover, we have

$$
\left|\partial_{x}^{\alpha} \partial_{\xi}^{\beta} g(t ; x, \xi)\right| \leq C_{\alpha \beta}\langle t \xi\rangle^{\nu-|\alpha|}\langle\xi\rangle^{\rho-|\beta|} \quad \text { for } x \in K, \xi \in \boldsymbol{R}^{n}
$$

and the other claims follow from the asymptotic expansion formula.
By Lemma 3.1, we learn that the principal symbol of $L(t)$ is given by $\ell(t ; x, \xi)$, and the remainder symbol $r(t ; x, \xi)$ satisfies

$$
\left|\partial_{x}^{\alpha} \partial_{\xi}^{\beta} r(t ; x, \xi)\right| \leq C_{\alpha \beta}\left(\langle t \xi\rangle^{-\mu-2-|\alpha|}\langle\xi\rangle^{-|\beta|}+\langle t \xi\rangle^{-\mu-|\alpha|}\langle\xi\rangle^{-2-|\beta|}\right)
$$

for $x \in K \subset \subset \boldsymbol{R}^{n}, t \in\left[t_{0}, 0\right]$. Note that the subprincipal symbol vanishes by virtue of the Weyl calculus.

In order to prove Theorem 1.2, we characterize the wave front set of $u_{0}$ in terms of $u\left(t_{0}\right)=e^{-i t_{0} H} u_{0}$ with $t_{0}<0$. Let $a \in C_{0}^{\infty}\left(\boldsymbol{R}^{2 n}\right)$ such that $a\left(x_{0}, \xi_{0}\right) \neq 0$ and supported in a small neighborhood of $\left(x_{0}, \xi_{0}\right)$, and set

$$
a^{\lambda}(x, \xi)=a\left(x, \frac{\xi}{\lambda}\right)
$$

We also set

$$
A^{\lambda}(t)=e^{i W\left(t, D_{x}\right)} e^{-i t H} a^{\lambda}\left(x, D_{x}\right) e^{i t H} e^{-i W\left(t, D_{x}\right)}
$$

for $t \in\left[t_{0}, 0\right] . A^{\lambda}$ satisfies the Heisenberg equation:

$$
\begin{equation*}
\frac{d}{d t} A^{\lambda}(t)=-i\left[L(t), A^{\lambda}(t)\right] \tag{3.2}
\end{equation*}
$$

We now construct an asymptotic solution of (3.1) with the initial condition:

$$
A^{\lambda}(0)=e^{i W\left(0, D_{x}\right)} a^{\lambda}\left(x, D_{x}\right) e^{-i W\left(0, D_{x}\right)}=\tilde{a}^{\lambda}\left(x, D_{x}\right) .
$$

We note that the principal symbol of $\tilde{a}^{\lambda}(x, \xi)$ is give by $a(x-R \hat{\xi}, \xi / \lambda)$, and $\tilde{a}^{\lambda}(x, \xi)$ is supported in a neighborhood of $\left(x_{0}+R \hat{\xi}_{0}, \lambda \xi_{0}\right)$ modulo $O\left(\lambda^{-N}\right)$-terms with any $N>0$, where we denote $\hat{\xi}=\xi /|\xi|$.

We note that if $A^{\lambda}(t)$ is a pseudodifferential operator, the principal symbol of the right hand side of (3.2) is given by $-\left\{\ell, a^{\lambda}\right\}$, where $a^{\lambda}(t ; \cdot, \cdot)$ is the symbol of $A^{\lambda}(t)$. Then by the computation in Subsection 3.1, we learn that $a^{\lambda} \circ S_{t}^{-1}$ is an approximate solution to the transport equation. Actually, we can construct an asymptotic solution to (3.2):

Proposition 3.2. Let $a \in C_{0}^{\infty}\left(\boldsymbol{R}^{2 n}\right)$ supported in a sufficiently small neighborhood of $\left(x_{0}, \xi_{0}\right)$. Then there exists $\psi^{\lambda}(t ; \cdot, \cdot) \in C_{0}^{\infty}\left(\boldsymbol{R}^{2 n}\right)$ such that
(i) We write $G^{\lambda}(t)=\psi^{\lambda}\left(t ; x, D_{x}\right)$. Then

$$
G^{\lambda}(0)=e^{i W\left(0, D_{x}\right)} a^{\lambda}\left(x, D_{x}\right) e^{-i W\left(0, D_{x}\right)}
$$

modulo $O\left(\lambda^{-\infty}\right)$-terms.
(ii) $\psi^{\lambda}(t ; \cdot, \cdot)$ is supported in $S_{t}\left[\operatorname{supp} a^{\lambda}\right]$.
(iii) For any $\alpha, \beta \in \boldsymbol{Z}_{+}^{n}$, there is $C_{\alpha \beta}>0$ such that

$$
\left|\partial_{x}^{\alpha} \partial_{\xi}^{\beta} \psi^{\lambda}(t ; x, \xi)\right| \leq C_{\alpha \beta} \lambda^{-|\beta|}, \quad t \in\left[t_{0}, 0\right], x, \xi \in \boldsymbol{R}^{n}, \lambda \gg 0
$$

(iv) The principal symbol of $\psi^{\lambda}$ is given by $a^{\lambda} \circ S_{t}^{-1}$, i.e.,

$$
\left|\partial_{x}^{\alpha} \partial_{\xi}^{\beta}\left(\psi^{\lambda}(t ; x, \xi)-a^{\lambda} \circ S_{t}^{-1}(x, \xi)\right)\right| \leq C_{\alpha \beta} \lambda^{-1-|\beta|}
$$

for $t \in\left[t_{0}, 0\right], x, \xi \in \boldsymbol{R}^{n}, \lambda \gg 0$.
(v) For $t \in\left[t_{0}, 0\right]$,

$$
\left\|\frac{d}{d t} G^{\lambda}(t)+i\left[L(t), G^{\lambda}(t)\right]\right\|_{\mathscr{L}\left(L^{2}\left(\boldsymbol{R}^{n}\right)\right)}=O\left(\lambda^{-\infty}\right) \quad \text { as } \lambda \rightarrow+\infty .
$$

We postpone the proof of Proposition 3.2 to the next subsection, and we complete the proof of Theorem 1.2.

Proof of Theorem 1.2. By Proposition 3.2 and the construction of $L(t)$, we have

$$
\left\|\frac{d}{d t}\left(e^{i t H} e^{-i W\left(t, D_{x}\right)} G^{\lambda}(t) e^{i W\left(t, D_{x}\right)} e^{-i t H}\right)\right\| \leq C_{N} \lambda^{-N}
$$

with any $N$ as $\lambda \rightarrow+\infty$. This implies

$$
\begin{aligned}
\| e^{i t_{0} H} e^{-i W\left(t_{0}, D_{x}\right)} G^{\lambda}\left(t_{0}\right) e^{i W\left(t_{0}, D_{x}\right)} & e^{-i t_{0} H} u_{0} \\
& -e^{-i W\left(0, D_{x}\right)} G^{\lambda}(0) e^{i W\left(0, D_{x}\right)} u_{0} \| \leq C_{N} \lambda^{-N} .
\end{aligned}
$$

By the condition (i) of Proposition 3.2, we have

$$
\begin{equation*}
\left|\left\|G^{\lambda}\left(t_{0}\right) e^{i W\left(t_{0}, D_{x}\right)} u\left(t_{0}\right)\right\|-\left\|a^{\lambda}\left(x, D_{x}\right) u_{0}\right\|\right| \leq C_{N} \lambda^{-N} \tag{3.3}
\end{equation*}
$$

where $u(t)=e^{-i t H} u_{0}$. We note that $\psi^{\lambda}\left(t_{0} ; x, \xi\right)$ is supported in $S_{t_{0}}\left[\operatorname{supp} a^{\lambda}\right]$, and the principal symbol is given by $a^{\lambda} \circ S_{t_{0}}^{-1}$. Hence, in particular,

$$
\begin{equation*}
\left|\psi^{\lambda}\left(t_{0} ; x, \xi\right)\right| \geq \varepsilon>0 \tag{3.4}
\end{equation*}
$$

for $\left|x-z_{-}\left(x_{0}, \xi_{0}\right)\right| \leq \delta,\left|\xi-\lambda \xi_{-}\left(x_{0}, \xi_{0}\right)\right| \leq \delta \lambda$ and $\lambda \gg 0$ with some $\delta, \varepsilon>0$.
Now we suppose $\left(x_{0}, \xi_{0}\right) \notin W F\left(u_{0}\right)$. Then by choosing $a$ supported in a sufficiently small neighborhood of ( $x_{0}, \xi_{0}$ ), we may suppose

$$
\left\|a^{\lambda}\left(x, D_{x}\right) u_{0}\right\|=O\left(\lambda^{-\infty}\right) \quad \text { as } \lambda \rightarrow+\infty .
$$

Then by (3.3) we have

$$
\begin{equation*}
\left\|G^{\lambda}\left(t_{0}\right) e^{i W\left(t_{0}, D_{x}\right)} u\left(t_{0}\right)\right\|=O\left(\lambda^{-\infty}\right) \tag{3.5}
\end{equation*}
$$

and this implies

$$
\left(z_{-}\left(x_{0}, \xi_{0}\right), \xi_{-}\left(x_{0}, \xi_{0}\right)\right) \notin W F\left(e^{i W\left(t_{0}, D_{x}\right)} u\left(t_{0}\right)\right)
$$

by virtue of (3.4).

Conversely, if $\left(z_{-}\left(x_{0}, \xi_{0}\right), \xi_{-}\left(x_{0}, \xi_{0}\right)\right) \notin W F\left(e^{i W\left(t_{0}, D_{x}\right)} u\left(t_{0}\right)\right)$ then also by taking a supported in a sufficiently small neighborhood of ( $x_{0}, \xi_{0}$ ), we have (3.5) since $\psi^{\lambda}\left(t_{0} ; \cdot, \cdot\right)$ is supported in $S_{t_{0}}\left[\operatorname{supp} a^{\lambda}\right]$ modulo $O\left(\lambda^{-\infty}\right)$-terms, and it is very close to $S_{-}\left[\operatorname{supp} a^{\lambda}\right]$ if $\lambda$ is large. Then again by (3.3), we have $\left\|a^{\lambda}\left(x, D_{x}\right) u_{0}\right\|=O\left(\lambda^{-\infty}\right)$, and hence $\left(x_{0}, \xi_{0}\right) \notin W F\left(u_{0}\right)$.

### 3.3. Proof of Proposition 3.2.

We note

$$
R+\delta|t \xi| \leq\left|\partial_{\xi} W(t, \xi)\right| \leq R+C|t \xi|
$$

for $t \in\left[t_{0}, 0\right], \xi \in \boldsymbol{R}^{n}$ with some $\delta, C>0$. Using this and (3.1), for any $\alpha, \beta \in \boldsymbol{Z}_{+}^{n}$ and $K \subset \subset \boldsymbol{R}^{n}$, we have

$$
\left|\partial_{x}^{\alpha} \partial_{\xi}^{\beta} \ell(t ; x, \xi)\right| \leq C_{\alpha \beta K}\left(\langle t \xi\rangle^{-1-\mu-|\alpha|}\langle\xi\rangle^{2-|\beta|}+\langle t \xi\rangle^{1-\mu-|\alpha|}\langle\xi\rangle^{-|\beta|}\right)
$$

for $t \in\left[t_{0}, 0\right], x \in K$ and $\xi \in \boldsymbol{R}^{n}$.
Let $a_{0}^{\lambda} \in C_{0}^{\infty}\left(\boldsymbol{R}^{2 n}\right)$ such that

$$
e^{i W\left(0, D_{x}\right)} a^{\lambda}\left(x, D_{x}\right) e^{-i W\left(0, D_{x}\right)}=\left(a_{0}^{\lambda} \circ S_{0}^{-1}\right)\left(x, D_{x}\right)
$$

modulo $O\left(\lambda^{-\infty}\right)$-terms. It is easy to see that the principal symbol of $a_{0}^{\lambda}$ is $a^{\lambda}(x, \xi)$, and that $a_{0}^{\lambda} \in S\left(1, d x^{2}+\lambda^{-2} d \xi^{2}\right)$. We may suppose supp $a_{0}^{\lambda}=\operatorname{supp} a^{\lambda}$. We now set

$$
\psi_{0}(t ; x, \xi)=a_{0}^{\lambda} \circ S_{t}^{-1}(x, \xi)
$$

Then as we observed in Subsection 3.1, $\psi^{\lambda}$ satisfies

$$
\frac{\partial}{\partial t} \psi_{0}(t ; x, \xi)=-\left\{\ell, \psi_{0}\right\}(t ; x, \xi)
$$

We set

$$
r_{0}(t ; x, \xi)=\frac{\partial}{\partial t} \psi_{0}\left(t ; x, D_{x}\right)+i\left[L(t), \psi_{0}\left(t ; x, D_{x}\right)\right] .
$$

Then by the asymptotic expansion formula, $r_{0} \in S\left(\lambda^{-1}, d x^{2}+\lambda^{-2} d \xi^{2}\right)$, and $r_{0}$ is supported essentially (i.e., modulo $O\left(\lambda^{-\infty}\right)$-terms) in $S_{t}\left[\operatorname{supp} a^{\lambda}\right]$. Next we solve the transport equation:

$$
\frac{\partial}{\partial t} \psi_{1}(t ; x, \xi)+\left\{\ell, \psi_{1}\right\}(t ; x, \xi)=-r_{0}(t ; x, \xi)
$$

with the initial condition $\psi_{1}(0 ; x, \xi)=0$. It is easy to show that $\psi_{1}(t, \cdot, \cdot) \in$ $S\left(\lambda^{-1}, d x^{2}+\lambda^{-2} d \xi^{2}\right)$ and it is bounded in $t \in\left[t_{0}, 0\right]$. Moreover, $\psi_{1}$ is supported in $S_{t}\left[\operatorname{supp} a^{\lambda}\right]$.

We set

$$
r_{1}(t ; x, \xi)=\frac{\partial}{\partial t} \psi_{1}(t ; x, \xi)+i\left[L(t), \psi_{1}\left(t ; x, D_{x}\right)\right]+r_{0}\left(t ; x, D_{x}\right)
$$

then $r_{1}(t ; \cdot, \cdot) \in S\left(\lambda^{-2}, d x^{2}+\lambda^{-2} d \xi^{2}\right)$ and supp $r_{1}(t ; \cdot, \cdot) \subset S_{t}\left[\operatorname{supp} a^{\lambda}\right]$ essentially for $t \in\left[t_{0}, 0\right]$. We iterate this procedure to obtain $\psi_{j} \in S\left(\lambda^{-j}, d x^{2}+\lambda^{-2} d \xi^{2}\right)$ such that $\operatorname{supp} \psi_{j}(t ; \cdot, \cdot) \subset S_{t}\left[\operatorname{supp} a^{\lambda}\right]$ essentially for $t \in\left[t_{0}, 0\right]$. Then we set

$$
\psi^{\lambda}(t ; x, \xi) \sim \sum_{j=0}^{\infty} \psi_{j}(t ; x, \xi) \in S\left(1, d x^{2}+\lambda^{-2} d \xi^{2}\right)
$$

in the sense of the asymptotic sum as $\lambda \rightarrow+\infty$. By the construction of the asymptotic sum, we may suppose $\operatorname{supp} \psi^{\lambda}(t ; \cdot, \cdot) \subset S_{t}\left[\operatorname{supp} a^{\lambda}\right]$ essentially for $t \in$ $\left[t_{0}, 0\right]$. Now it is straightforward to check $\psi$ satisfies the required properties.

### 3.4. Proof of Theorem 1.1.

We denote

$$
T_{t}(x, \xi)=\left(x-\partial_{\xi} W(t, \xi), \xi\right)
$$

so that

$$
S_{t}=T_{t} \circ \exp t H_{p}
$$

We also denote

$$
b_{t}^{\lambda}(x, \xi)=a^{\lambda} \circ \exp \left(-t H_{p}\right)(x, \xi)
$$

Then, in order to prove Theorem 1.1, it suffices to show

$$
\left\|b_{t_{0}}^{\lambda}\left(x, D_{x}\right) u\left(t_{0}\right)\right\|=O\left(\lambda^{-\infty}\right) \quad \text { as } \lambda \rightarrow+\infty
$$

if and only if $\left(x_{0}, \xi_{0}\right) \notin W F\left(u_{0}\right)$, where $u(t)=e^{-i t H} u_{0}, a$ is supported in a small
neighborhood of $\left(x_{0}, \xi_{0}\right)$ and $t_{0}<0$. We note

$$
b_{t}^{\lambda}=a^{\lambda} \circ\left[\exp t H_{p}\right]^{-1}=a^{\lambda} \circ S_{t}^{-1} \circ T_{t},
$$

namely,

$$
b_{t}^{\lambda}(x, \xi)=\left(a^{\lambda} \circ S_{t}^{-1}\right)\left(x-\partial_{\xi} W(t, \xi), \xi\right) .
$$

By direct computations as in the proof of Lemma 3.1, we can show

$$
e^{i W\left(t, D_{x}\right)} b_{t}^{\lambda}\left(x, D_{x}\right) e^{-i W\left(t, D_{x}\right)}=c_{t}^{\lambda}\left(x, D_{x}\right)
$$

where $c_{t}^{\lambda} \in C_{0}^{\infty}\left(\boldsymbol{R}^{n}\right)$ modulo $O\left(\lambda^{-\infty}\right)$, and as an $h$-pseudodifferential operator (with $h=\lambda^{-1}$ ), the principal symbol is given by $\left(a^{\lambda} \circ S_{t}^{-1}\right)(x, \xi)=$ $\left(a \circ\left(S_{\lambda t}^{\lambda}\right)^{-1}\right)(x, \xi / \lambda)$. Moreover, if we write $\tilde{c}_{t}^{\lambda}(x, \xi)=c_{t}^{\lambda}(x, \lambda \xi)$, then $\tilde{c}_{t}^{\lambda}$ is supported in an arbitrarily small neighborhood of $S_{-}[\operatorname{supp} a]$ if $\lambda$ is sufficiently large, and the principal symbol is $a \circ\left(S_{\lambda t}^{\lambda}\right)^{-1}$. We can also show (as in Lemma 3.1) that $\tilde{c}_{t}^{\lambda}$ is bounded in $C_{0}^{\infty}\left(\boldsymbol{R}^{2 n}\right)$ as $\lambda \rightarrow \infty$. Since

$$
\left\|b_{t_{0}}^{\lambda}\left(x, D_{x}\right) u\left(t_{0}\right)\right\|=\left\|\tilde{c}_{t}^{\lambda}\left(x, h D_{x}\right) e^{i W\left(t, D_{x}\right)} u\left(t_{0}\right)\right\|
$$

now Theorem 1.1 follows from Theorem 1.2 combined with the standard characterization of the wave front set in terms of $h$-pseudodifferential operators.

## A. Appendix.

Lemma A.1. Suppose $n \geq 2, f \in C^{1}\left(\boldsymbol{R}^{n}\right)$ and suppose

$$
\left|\partial_{x} f(x)\right| \leq C\langle x\rangle^{\beta}, \quad x \in \boldsymbol{R}^{n}
$$

with some $C>0, \beta \in \boldsymbol{R}$. Then

$$
|f(x)-f(y)| \leq \frac{\pi}{2} C \max \left(\langle x\rangle^{\beta},\langle y\rangle^{\beta}\right)|x-y| .
$$

The same estimate holds for $n=1$ if $x \cdot y>0$.
Proof. The claim is obvious if $\beta \geq 0$ or $n=1$, and we suppose $n \geq 2$ and $\beta<0$. Let $|x| \geq|y| \geq 0$ and let $S=\left\{z \in \boldsymbol{R}^{n}| | z|=|y|\}\right.$ be the sphere of radius $|y|$ with the center at the origin. Let $\ell$ be the (straight) line segment connecting
$x$ and $y$. If $\ell$ and $S$ intersect only at $y$, then we can use the standard argument of show

$$
|f(x)-f(y)|=\int_{\ell}|\nabla f(z)||d z| \leq C\langle y\rangle^{\beta}|x-y|
$$

If $\ell$ and $S$ intersect at $y$ and $y^{\prime}$, we denote the line segments connecting $y$ and $y^{\prime}$, and $y^{\prime}$ and $x$, by $\ell^{\prime}$ and $\ell^{\prime \prime}$, respectively. Then $|x-y|=|\ell|=\left|\ell^{\prime}\right|+\left|\ell^{\prime \prime}\right|$. We note the length of the shortest geodesic connecting $y$ and $y^{\prime}$ on $S$ (which we denote by $\left.\gamma_{1}\right)$ is equal to or less than $(\pi / 2)\left|\ell^{\prime}\right|$. We set $\gamma=\gamma_{1}+\ell^{\prime \prime}$, which is a piecewise $C^{1}$-path connecting $y$ and $x$, and

$$
|\gamma| \leq \frac{\pi}{2}\left|\ell^{\prime}\right|+\left|\ell^{\prime \prime}\right| \leq \frac{\pi}{2}|x-y|
$$

Since $\gamma$ is contained in $\{z||z| \geq|y|\}$, we have

$$
|f(x)-f(y)| \leq \int_{\gamma}|\nabla f(z)||d z| \leq \frac{\pi}{2} C\langle y\rangle^{\beta}|x-y|
$$
