# GENERALIZED ALEXANDER DUALITY AND APPLICATIONS 

Tim RÖMER

(Received April 22, 1999)

## Introduction

Let $\Delta$ be a simplicial complex on the vertex set $[n], K$ a field, $S=K\left[x_{1}, \ldots, x_{n}\right]$ the polynomial ring and $K[\Delta]$ the Stanley-Reisner ring over $S$. In a series of papers ([4], [5], [7]) relations between Betti numbers of $K[\Delta]$ and those of the StanleyReisner ring $K\left[\Delta^{*}\right]$ of the Alexander dual $\Delta^{*}$ have been studied.

In this paper we extend these results to squarefree $S$-modules, which were introduced by Yanagawa in [6]. This will be accomplished by defining the dual of a squarefree $S$-module. The definition is a natural extension of the Alexander dual.

To define the generalized Alexander dual we will see that there is an equivalence of the categories of squarefree $S$-modules and squarefree $E$-modules, where $E$ denotes the exterior algebra. In the category of squarefree $E$-modules we may consider the $E$-dual $M^{*}=\operatorname{Hom}_{E}(M, E)$. If $M$ is the squarefree $E$-module corresponding to a squarefree $S$-module $N$, then we call the squarefree $S$-module corresponding to $M^{*}$ the generalized Alexander dual of $N$. The construction which assigns to a squarefree $S$-module a squarefree $E$-module is described in [1].

For the applications it is important to consider the so called distinguished pairs $(l, j)$ introduced by Aramova and Herzog in [3]. Distinguished pairs are homological invariants of modules over the exterior algebra. The definition is based on the Cartan homology, an analogue to the Koszul homology in the polynomial ring. We generalize this definition to homological distinguished pairs $(l, j)$ and cohomological distinguished pairs $(l, j)$.

We prove that a homological distinguished pair $(l, j)$ of $M$ corresponds to the cohomological distinguished pair $(l, n-j)$ of $M^{*}$, which in turn corresponds to the homological distinguished pair $(l, n-j-l+1)$ of $M^{*}$. These homological considerations lead to the following results about graded Betti numbers:

Let $\beta_{i, i+j}$ be the graded Betti number of a finitely generated graded $S$-module. Bayer, Charalambous and S. Popescu introduced in [4] a refinement of the MumfordCastelnuovo regularity, the extremal Betti numbers. They call a Betti number $\beta_{i, i+j} \neq 0$ extremal if $\beta_{l, l+r}=0$ for all $r \geq j$ and all $l \geq i$ with $(l, r) \neq(i, j)$. One of their results states the following: if $\beta_{i, i+j}(K[\Delta])$ is an extremal Betti number of $K[\Delta]$, then $\beta_{j+1, i+j}\left(K\left[\Delta^{*}\right]\right)$ is an extremal number of $K\left[\Delta^{*}\right]$ and $\beta_{i, i+j}(K[\Delta])=\beta_{j+1, i+j}\left(K\left[\Delta^{*}\right]\right)$.

In this paper we will prove a similar result for any squarefree $S$-module $N$ : if $\beta_{i, i+j}(N)$ is an extremal Betti number of $N$, then $\beta_{j, i+j}\left(N^{*}\right)$ is an extremal Betti number of $N^{*}$ and $\beta_{i, i+j}(N)=\beta_{j, i+j}\left(N^{*}\right)$. In particular for any pair of squarefree ideals $I_{\Delta} \subseteq I_{\Gamma}$ one has: if $\beta_{i, i+j}\left(I_{\Gamma} / I_{\Delta}\right)$ is an extremal number of $I_{\Gamma} / I_{\Delta}$, then $\beta_{j, i+j}\left(I_{\Delta^{*}} / I_{\Gamma^{*}}\right)$ is an extremal number of $I_{\Delta^{*}} / I_{\Gamma^{*}}$ and $\beta_{i, i+j}\left(I_{\Gamma} / I_{\Delta}\right)=\beta_{j, i+j}\left(I_{\Delta^{*}} / I_{\Gamma^{*}}\right)$.

The author is grateful to Prof. Herzog for the inspiring discussions on the subject of the paper.

## 1. Squarefree Modules and generalized Alexander Duality

We fix some notation and recall some definitions. For $a=\left(a_{1}, \ldots, a_{n}\right) \in \mathbb{N}^{n}$, we say $a$ is squarefree if $0 \leq a_{i} \leq 1$ for $i=1, \ldots, n$. We set $|a|=a_{1}+\ldots+a_{n}$ and $\operatorname{supp}(a)=\left\{i: a_{i} \neq 0\right\} \subseteq[n]:=\{1, \ldots, n\}$. Sometimes a squarefree vector $a$ and $F=$ $\operatorname{supp}(a)$ are identified. Let $\varepsilon_{i}=(0, \ldots, 1, \ldots, 0) \in \mathbb{N}^{n}$ be the vector, where the one is at the ith position. For an element $u$ of an $\mathbb{N}^{n}$-graded vector space $M=\bigoplus_{a \in \mathbb{N}^{n}} M_{a}$ the notation $\operatorname{deg}(u)=a$ is equivalent to $u \in M_{a}$; we set $\operatorname{supp}(\operatorname{deg}(u))=\operatorname{supp}(u)$ and $|\operatorname{deg}(u)|=|u|$.

Let $S=K\left[x_{1}, \ldots, x_{n}\right]$ be the symmetric algebra over a field $K$ and $\mathfrak{m}$ the graded maximal ideal $\left(x_{1}, \ldots, x_{n}\right)$ of $S$. Consider the natural $\mathbb{N}^{n}$-grading on $S$. For a monomial $x_{1}^{a_{1}} \ldots x_{n}^{a_{n}}$ with $a=\left(a_{1} \ldots, a_{n}\right)$ we set $x^{a}$.

Let $E=K\left\langle e_{1}, \ldots, e_{n}\right\rangle$ be the exterior algebra over an $n$-dimensional vector space $V$ with basis $e_{1}, \ldots, e_{n}$. We denote by $\mathcal{M}$ the category of finitely generated graded left and right $E$-modules $M$, satisfying $a x=(-1)^{|\operatorname{deg}(a)||\operatorname{deg}(x)|} x a$ for all homogeneous $a \in E$ and $x \in M$. For example every graded ideal $J \subseteq E$ belongs to $\mathcal{M}$. For an element $M \in \mathcal{M}$ we define $M^{*}=\operatorname{Hom}_{E}(M, E)$. Observe that ( $)^{*}$ is an exact contravariant functor $[2,5.1$ (a) $]$ and $M^{*} \in \mathcal{M}$. For a $K$-vector space $W$ we define $W^{\vee}:=\operatorname{Hom}_{K}(W, K)$. The following was proved in [2, $\left.5.1(\mathrm{~d})\right]:\left(M^{*}\right)_{i} \cong\left(M_{n-i}\right)^{\vee}$.

If $a \in \mathbb{N}^{n}$ is squarefree we set $e_{a}=e_{a_{j_{1}}} \wedge \ldots \wedge e_{a_{j_{k}}}$, where $\operatorname{supp}(a)=\left\{j_{1}<\ldots<j_{k}\right\}$ and we say $e_{a}$ is a monomial in $E$. For any $a \in \mathbb{N}^{n}$ we set $e_{a}=e_{\operatorname{supp}(a)}$. For monomials $u, v \in E$ with $\operatorname{supp}(v) \subseteq \operatorname{supp}(u)$ there exists an unique monomial $w \in E$ such that $v w=u$; then we set $w=v^{-1} u$. Notice that for monomials $u, v, w, z \in E$ the equalities below hold whenever the expressions are defined:

$$
\left(v^{-1} u\right) w=v^{-1}(u w) \quad \text { and } \quad\left(z^{-1} v\right)\left(v^{-1} u\right)=z^{-1} u
$$

A simplicial complex $\Delta$ is a collection of subsets of $[n]$ such that $\{i\} \in \Delta$ for $i=1, \ldots, n$, and that $F \in \Delta$ whenever $F \subseteq G$ for some $G \in \Delta$. Further we denote by $\Delta^{*}:=\{F: \bar{F} \notin \Delta\}$ the Alexander dual of $\Delta$. Then $K[\Delta]=S / I_{\Delta}$ is the StanleyReisner ring, where $I_{\Delta}=\left(x_{i_{1}} \ldots x_{i_{s}}:\left\{i_{1}, \ldots, i_{s}\right\} \notin \Delta\right)$, and $K\{\Delta\}:=E / J_{\Delta}$ is the exterior face ring, where $J_{\Delta}:=\left(e_{i_{1}} \wedge \ldots \wedge e_{i_{s}}:\left\{i_{1}, \ldots, i_{s}\right\} \notin \Delta\right)$.

The starting point of this section is a definition introduced by Yanagawa in [6].

Definition 1.1. A finitely generated $\mathbb{N}^{n}$-graded $S$-module $N=\bigoplus_{a \in \mathbb{N}^{n}} N_{a}$ is squarefree if the multiplication maps $N_{a} \ni y \mapsto x_{i} y \in N_{a+\varepsilon_{i}}$ is bijective for all $a \in \mathbb{N}^{n}$ and all $i \in \operatorname{supp}(a)$.

For example the Stanley-Reisner ring $K[\Delta]$ of a simplicial complex $\Delta$ is a squarefree module. It is easy to see that for $a \in \mathbb{N}^{n}$ and a squarefree module $N$ we have $\operatorname{dim}_{K} N_{a}=\operatorname{dim}_{K} N_{\text {supp }(a)}$ and $N$ is generated by its squarefree part $\left\{N_{a}: a \subseteq\right.$ $[n]\}$. Yanagawa proved in [6, 2.3, 2.4] that if $\varphi: N \rightarrow N^{\prime}$ is a $\mathbb{N}^{n}$-homogeneous homomorphism, where $N, N^{\prime}$ are squarefree modules, $\operatorname{Ker} \varphi$ and $\operatorname{Coker} \varphi$ are again squarefree. It follows that every syzygy module $\operatorname{Syz}_{i}(N)$ in a multigraded minimal free $S$-resolution $F_{\bullet}$ of $N$ is squarefree. Indeed the free $S$-module $F_{i}$ is generated by elements $f$ with $\operatorname{deg}(f)$ is squarefree and this is called a squarefree resolution. It follows that an $S$-module $N$ is squarefree if and only if $N$ has a squarefree resolution.

The following construction which is of crucial importance for this paper is due to Aramova, Avramov and Herzog [1]:
Let $\left(F_{\mathbf{\bullet}}, \theta\right)$ be an acyclic complex of free $\mathbb{N}^{n}$-graded $S$-modules. Furthermore we assume that each $F_{i}$ has a homogeneous basis $B_{i}$ with $\operatorname{deg}(f)$ is squarefree for all $f \in B_{i}$.

For $a \in \mathbb{N}^{n}$ and $f \in B_{i}$ we let $y^{(a)} f$ be a symbol to which we assign $\operatorname{deg}\left(y^{(a)} f\right)=$ $a+\operatorname{deg}(f)$. Now define the free $\mathbb{N}^{n}$-graded $E$-module $G_{l} \in \mathcal{M}$ with basis $y^{(a)} f$, where $a \in \mathbb{N}^{n}, f \in B_{i}, \operatorname{supp}(a) \subseteq \operatorname{supp}(f)$ and $l=|a|+i$. For $f \in B_{i}$ and

$$
\theta(f)=\sum_{j: f_{j} \in B_{i-1}} \lambda_{j} x^{b-b_{j}} f_{j} \quad \text { with } \lambda_{j} \in K, \quad b=\operatorname{deg}(f), \quad b_{j}=\operatorname{deg}\left(f_{j}\right),
$$

we define homomorphisms $G_{l} \rightarrow G_{l-1}$ of $\mathbb{N}^{n}$-graded $E$-modules by

$$
\begin{aligned}
& \gamma\left(y^{(a)} f\right)=(-1)^{|b|} \sum_{k \in \operatorname{supp}(a)} y^{\left(a-\varepsilon_{k}\right)} f e_{k}, \\
& \vartheta\left(y^{(a)} f\right)=(-1)^{|a|} \sum_{j: f_{j} \in B_{i-1}} y^{(a)} f_{j} \lambda_{j} e_{b_{j}}^{-1} e_{b} .
\end{aligned}
$$

Set $\delta=\gamma+\vartheta: G_{l} \rightarrow G_{l-1}$, then $\left(G_{\bullet}, \delta\right)$ is a complex of free $\mathbb{N}^{n}$-graded $E$-modules in $\mathcal{M}$. Indeed if $\left(G_{\bullet}^{\prime}, \delta\right)$ is the complex obtained by a different homogeneous basis $B^{\prime}$ of $F_{\bullet}$, then $G_{\bullet}$ and $G_{\bullet}^{\prime}$ are isomorph as complexes of $\mathbb{N}^{n}$-graded modules. Now there is the important theorem [1, 1.3]

Theorem 1.2. If $\left(F_{\bullet}, \theta\right)$ is the minimal free $\mathbb{N}^{n}$-graded $S$-resolution of a squarefree $S$-module $N$, then $\left(G_{\bullet}, \delta\right)$ is the minimal free $\mathbb{N}^{n}$-graded $E$-resolution of $N_{E}:=$ $\operatorname{Coker}\left(G_{1} \rightarrow G_{0}\right)$.

Proof. See the proof of $[1,1.3]$. There the theorem was proved for $S / I$, where $I$ is a squarefree monomial ideal, but the proof works also in this more generalized
situation.
$N$ and $N_{E}$ can also be seen as $\mathbb{N}$-graded modules over $S$ and $E$ by defining $N_{i}=$ $\bigoplus_{a:|a|=i} N_{a}$ and the same for $N_{E}$. By [1,2.1] we get the following

Corollary 1.3. Let $N$ be a squarefree $S$-module, then

$$
\beta_{i, i+j}^{E}\left(N_{E}\right)=\sum_{k=0}^{i}\binom{i+j-1}{j+k-1} \beta_{k, k+j}^{S}(N),
$$

where $\beta^{E}$ denotes graded Betti-numbers over the exterior algebra and $\beta^{S}$ graded Betti-numbers over the polynomial ring.

It is a natural question if this construction has an inverse. This means, given an $E$-module with its minimal free $E$-resolution we want to construct an $S$-module with a free $S$-resolution.

Definition 1.4. A finitely generated $\mathbb{N}^{n}$-graded $E$-module $M=\bigoplus_{a \in \mathbb{N}^{n}} M_{a}$ is square free if it has only squarefree components.

For example the exterior face ring $K\{\Delta\}$ obtained from a simplicial complex $\Delta$ is a squarefree $E$-module. Also for any squarefree $S$-module $N$, the $E$-module $N_{E}$ is squarefree as can be easily seen from its definition.

Now we consider the following inverse construction:
Let $M$ be a squarefree $E$-module with the minimal free $\mathbb{N}^{n}$-graded $E$-resolution $\left(G_{\bullet}, \delta\right)$. Let $B_{i}$ a homogeneous basis of $G_{i}$. Then we set $\tilde{B}_{i}:=\left\{f \in B_{i} \mid \operatorname{deg}(f)\right.$ is squarefree $\}$. We define a complex $\left(F_{\bullet}, \theta\right)$ of $S$-modules, where $F_{i}$ is a free $S$-module with basis $\tilde{B}_{i}$. If $f \in \tilde{B}_{i}$ and

$$
\delta(f)=\sum_{j: f_{j} \in \tilde{B}_{i-1}} f_{j} \lambda_{j} e_{b_{j}}^{-1} e_{b} \quad \text { with } b=\operatorname{deg}(f), \quad b_{j}=\operatorname{deg}\left(f_{j}\right) \text { and } \lambda_{j} \in K,
$$

then we set

$$
\theta(f)=\sum_{j: f_{j} \in \tilde{B}_{i-1}} f_{j} \lambda_{j} x^{b-b_{j}} .
$$

It is easy to see that $\left(F_{\bullet}, \theta\right)$ is indeed a complex. But a little more is true:
Theorem 1.5. If $\left(G_{\bullet}, \delta\right)$ is the minimal free $\mathbb{N}^{n}$-graded $E$-resolution of a squarefree E-module $M$, then $\left(F_{\bullet}, \theta\right)$ is the minimal free $\mathbb{N}^{n}$-graded $S$-resolution of $M_{S}:=$ $\operatorname{Coker}\left(F_{1} \rightarrow F_{0}\right)$ and $M_{S}$ is a squarefree $S$-module.

Proof. Let $\left(\tilde{F}_{\mathbf{\bullet}}, \tilde{\theta}\right)$ be the minimal free $\mathbb{N}^{n}$-graded $S$-resolution of the $S$-module $M_{S}$. By the first construction (see 1.2) we get a minimal free $\mathbb{N}^{n}$-graded $E$-resolution $(\tilde{G} \bullet, \tilde{\delta})$ of the $E$-module $\left(M_{S}\right)_{E}$. The definitions imply that $\left(M_{S}\right)_{E}=M$. Therefore $\tilde{G}_{\bullet} \cong G \bullet$ as complexes, since both complexes are minimal free $E$-resolutions of $M$. If we apply the second construction for $\left(\tilde{G}_{\bullet}, \tilde{\delta}\right)$ we get $\left(\tilde{F}_{\bullet}, \tilde{\theta}\right)$. All in all it follows that $\tilde{F}_{\bullet} \cong F_{\bullet}$ as complexes and hence $\left(F_{\bullet}, \theta\right)$ is the minimal free $\mathbb{N}^{n}$-graded $S$-resolution of the $S$-module $M_{S}$. Since $F_{0}, F_{1}$ are squarefree $S$-modules, we see that $M_{S}$ is a squarefree $S$-module.

We get immediately
Corollary 1.6. Let $N$ be a squarefree $S$-module and $M$ be a squarefree $E$ module. We denote by $N_{E}$ the squarefree E-module defined in 1.2 and by $M_{S}$ the squarefree $S$-module defined in 1.5. Then

$$
\left(M_{S}\right)_{E} \cong M \quad \text { and } \quad\left(N_{S}\right)_{E} \cong N
$$

Now consider two squarefree $S$-modules $N, N^{\prime}$ and a $\mathbb{N}^{n}$-homogeneous homomorphism $\varphi: N \rightarrow N^{\prime}$. Take the minimal free $\mathbb{N}^{n}$-graded $S$-resolution $\left(F_{\bullet}, \theta\right)$ of $N$ and the minimal free $\mathbb{N}^{n}$-graded $S$-resolution $\left(F_{\bullet}^{\prime}, \theta^{\prime}\right)$ of $N^{\prime}$ with homogeneous bases $B_{\bullet}$ and $B_{\bullet}^{\prime}$. It is well known that $\varphi$ induce a complex homomorphism $\varphi_{\bullet}: F_{\bullet} \rightarrow F_{\bullet}^{\prime}$. By construction 1.2 we get minimal free $\mathbb{N}^{n}$-graded $E$-resolutions $\left(G_{\bullet}, \delta\right)$ and $\left(G_{\bullet}^{\prime}, \delta^{\prime}\right)$ of $N_{E}$ and $N_{E}^{\prime}$, respectively. Let $f \in B_{i}$ and $\varphi_{i}(f)=\sum_{j: f_{j}^{\prime} \in B_{i}^{\prime}} \lambda_{j} x^{b-b_{j}^{\prime}} f_{j}^{\prime}$, where $b=\operatorname{deg}(f)$ and $b_{j}^{\prime}=\operatorname{deg}\left(f^{\prime}\right)$. Then we define a complex homomorphism

$$
\psi_{\bullet}: G \bullet \longrightarrow G_{\bullet}^{\prime} \quad y^{(a)} f \longmapsto \sum_{j: f_{j}^{\prime} \in B_{i}^{\prime}} y^{(a)} f_{j} \lambda_{j} e_{b_{j}}^{-1} e_{b},
$$

for all $a \in \mathbb{N}^{n}$ and all $f \in B_{i}$. Now $\psi_{\bullet}$ induces a $\mathbb{N}^{n}$-homogeneous homomorphism $\psi: M_{E} \rightarrow M_{E}^{\prime}$.

Similary two squarefree $E$-modules $M, M^{\prime}$ and a $\mathbb{N}^{n}$-homogeneous homomorphism $\psi: M \rightarrow M^{\prime}$ induce a $\mathbb{N}^{n}$-homogeneous homomorphism $\varphi: M_{S} \rightarrow M_{S}^{\prime}$.

It turns out that these assignments define functors. Denote by $\mathcal{S Q}(S)$ the abelian category of the squarefree $S$-modules, where the morphisms are the $\mathbb{N}^{n}$-homogeneous homomorphisms. Let $\mathcal{S Q}(E)$ be the abelian category of the squarefree $E$-modules, where the morphisms are again the $\mathbb{N}^{n}$-homogeneous homomorphisms. Then

$$
F: \mathcal{S Q}(S) \longrightarrow \mathcal{S Q}(E), \quad N \longmapsto N_{E}
$$

and

$$
G: \mathcal{S Q}(E) \longrightarrow \mathcal{S Q}(S), \quad M \longmapsto M_{S}
$$

are additive covariant exact functors of abelian categories. Hence we see by 1.6 that the categories $\mathcal{S Q}(S)$ and $\mathcal{S Q}(E)$ are equivalent.
We conclude the section with an example. Let $\Gamma \subseteq \Delta$ be simplicial complexes. Then $I_{\Gamma} / I_{\Delta}$ is an element of $\mathcal{S Q}(S)$ and $J_{\Gamma} / J_{\Delta}$ is an element of $\mathcal{S Q}(E)$.

Corollary 1.7. With the notation introduced we have

$$
\left(I_{\Gamma} / I_{\Delta}\right)_{E}=J_{\Gamma} / J_{\Delta} \quad \text { and } \quad\left(J_{\Gamma} / J_{\Delta}\right)_{S}=I_{\Gamma} / I_{\Delta}
$$

We further have
Lemma 1.8. $\left(J_{\Gamma} / J_{\Delta}\right)^{*} \cong J_{\Delta^{*}} / J_{\Gamma^{*}}$.
Proof. We see that $\left(E / J_{\Delta}\right)^{*}=\operatorname{Hom}_{E}\left(E / J_{\Delta}, E\right) \cong 0:_{E} J_{\Delta}=J_{\Delta^{*}}$. Consider the exact sequence $0 \rightarrow J_{\Gamma} / J_{\Delta} \rightarrow E / J_{\Delta} \rightarrow E / J_{\Gamma} \rightarrow 0$. Since the functor ( $)^{*}$ is exact we get the exact sequence $0 \rightarrow\left(E / J_{\Gamma}\right)^{*} \rightarrow\left(E / J_{\Delta}\right)^{*} \rightarrow\left(J_{\Gamma} / J_{\Delta}\right)^{*} \rightarrow 0$, and the assertion follows.

This lemma gives us the hint how to define the generalized Alexander dual for elements in $\mathcal{S Q}(S)$.

Definition 1.9. Let $N \in \mathcal{S Q}(S)$. Then we call

$$
N^{*}=\left(\left(N_{E}\right)^{*}\right)_{S}
$$

the generalized Alexander dual of $N$.
We note that

$$
()^{*}: \mathcal{S Q}(S) \longrightarrow \mathcal{S Q}(S), \quad N \longmapsto N^{*}
$$

is a contravariant exact functor on the category $\mathcal{S Q}(S)$.

## 2. The Cartan complex

In this section we recall the Cartan complex which provides a minimal free graded $E$-resolution of the residue class field $K$ of the exterior algebra $E$.

For a sequence $\mathbf{v}=v_{1}, \ldots, v_{m} \subseteq E_{1}$ the Cartan complex $C_{\bullet}(\mathbf{v} ; E)$ is defined to be the free divided power algebra $E\left\langle x_{1}, \ldots, x_{m}\right\rangle$ together with a differential $\delta$. The free divided power algebra $E\left\langle x_{1}, \ldots, x_{m}\right\rangle$ is generated over $E$ by the divided powers $x_{i}^{(j)}$ for $i=1, \ldots, m$ and $j \geq 0$, satisfying the relations $x_{i}^{(j)} x_{i}^{(k)}=((j+k)!/(j!k!)) x_{i}^{(j+k)}$. We set $x_{i}^{(0)}=1$ and $x_{i}^{(1)}=x_{i}$ for $i=1, \ldots, m$. Therefore $C_{\bullet}(\mathbf{v} ; E)$ is a free $E$-module with basis $x^{(a)}=x_{1}^{\left(a_{1}\right)} \ldots x_{m}^{\left(a_{m}\right)}, a \in \mathbb{N}^{m}$. We set $\operatorname{deg} x^{(a)}=i$ if $|a|=a_{1}+\ldots+a_{m}=i$ and
$C_{i}(\mathbf{v} ; E)=\bigoplus_{|a|=i} E x^{(a)}$. The $E$-linear differential $\delta$ on $C_{\bullet}(\mathbf{v} ; E)$ is defined as follows: for $x^{(a)}=x_{1}^{\left(a_{1}\right)} \ldots x_{m}^{\left(a_{m}\right)}$ we set

$$
\delta\left(x^{(a)}\right)=\sum_{a_{i}>0} v_{i} x_{1}^{\left(a_{1}\right)} \ldots x_{i}^{\left(a_{i}-1\right)} \ldots x_{m}^{\left(a_{m}\right)}
$$

Now one sees easily that $\delta \circ \delta=0$ and $C_{\bullet}(\mathbf{v} ; E)$ is indeed a complex.
Definition 2.1. Let $M \in \mathcal{M}, \mathbf{v}=v_{1}, \ldots, v_{m} \subseteq E_{1}$. The complexes

$$
C_{\bullet}(\mathbf{v} ; M)=C_{\bullet}(\mathbf{v} ; E) \otimes_{E} M, C^{\bullet}(\mathbf{v} ; M)=\operatorname{Hom}_{E}\left(C_{\bullet}(\mathbf{v} ; E), M\right)
$$

are called Cartan complex and Cartan cocomplex of $\mathbf{v}$ with values in $M$. We denote the homology of these complexes by

$$
H_{\bullet}(\mathbf{v} ; M), H^{\bullet}(\mathbf{v} ; M)
$$

and call it the Cartan homology and Cartan cohomology.
One can see that the elements of $C^{i}(\mathbf{v} ; M)$ can be identified with homogeneous polynomials $\sum m_{a} y^{a}$ in the variables $y_{1}, \ldots, y_{m}$ and coefficients $m_{a} \in M$, where $y^{a}=$ $y^{a_{1}} \ldots y^{a_{m}}$ for $a \in \mathbb{N}^{m}, a=\left(a_{1}, \ldots, a_{m}\right)$. An element $m_{a} y^{a} \in C^{\bullet}(\mathbf{v} ; M)$ is characterized by the following property

$$
m_{a} y^{a}\left(x^{(b)}\right)= \begin{cases}m_{a} & b=a, \\ 0 & b \neq a .\end{cases}
$$

Set $y_{\mathrm{v}}=\sum_{i=1}^{n} v_{i} y_{i}$, then

$$
\delta^{i}: C^{i}(\mathbf{v} ; M) \longrightarrow C^{i+1}(\mathbf{v} ; M), \quad f \longmapsto y_{\mathbf{v}} f .
$$

Now there is a naturally grading of the complexes and their homology. We set

$$
\operatorname{deg} x_{i}=1, C_{j}(\mathbf{v} ; M)_{i}:=\operatorname{span}_{K}\left(m_{a} x^{(b)}:|a|+|b|=i,|b|=j\right),
$$

and

$$
\operatorname{deg} y_{i}=-1, C^{j}(\mathbf{v} ; M)_{i}:=\operatorname{span}_{K}\left(m_{a} y^{b}:|a|-|b|=i,|b|=j\right) .
$$

In [3, 4.2] the following is shown
Proposition 2.2. Let $M \in \mathcal{M}$. Then for all $i$ there is an isomorphism of graded E-modules

$$
H_{i}(\mathbf{v} ; M)^{*} \cong H^{i}\left(\mathbf{v} ; M^{*}\right)
$$

Cartan homology can be computed recursively. Let $\mathbf{v}=v_{1}, \ldots, v_{m}$ be a sequence in $E_{1}$. For $j=1, \ldots, m-1$ the following sequence is exact

$$
0 \rightarrow C_{\bullet}\left(v_{1}, \ldots, v_{j} ; M\right) \xrightarrow{\iota} C_{\bullet}\left(v_{1}, \ldots, v_{j+1} ; M\right) \xrightarrow{\tau} C_{\bullet-1}\left(v_{1}, \ldots, v_{j+1} ; M\right)(-1) \rightarrow 0
$$

Here $\iota$ is a natural inclusion map, where $\tau$ is given by

$$
\tau\left(g_{0}+g_{1} x_{j+1}+\ldots+g_{k} x_{j+1}^{(k)}\right)=g_{1}+g_{2} x_{j+1}+\ldots+g_{k} x_{j+1}^{(k-1)}
$$

with $g_{i} \in C_{i-k}\left(v_{1}, \ldots, v_{j} ; M\right)$. This implies (see [3, 4.1, 4.3])

Proposition 2.3. Let $M \in \mathcal{M}$. Then for all $j=1, \ldots, m-1$ there exist exact sequences of graded E-modules

$$
\begin{aligned}
\ldots \longrightarrow & H_{i}\left(v_{1}, \ldots, v_{j} ; M\right) \xrightarrow{\alpha_{i}} H_{i}\left(v_{1}, \ldots, v_{j+1} ; M\right) \xrightarrow{\beta_{i}} H_{i-1}\left(v_{1}, \ldots, v_{j+1} ; M\right)(-1) \\
& \xrightarrow{\delta_{i-1}} H_{i-1}\left(v_{1}, \ldots, v_{j} ; M\right) \xrightarrow{\alpha_{i-1}} H_{i-1}\left(v_{1}, \ldots, v_{j+1} ; M\right) \xrightarrow{\beta_{i-1}} \ldots
\end{aligned}
$$

and

$$
\begin{gathered}
\ldots \longrightarrow H^{i-1}\left(v_{1}, \ldots, v_{j+1} ; M\right) \longrightarrow H^{i-1}\left(v_{1}, \ldots, v_{j} ; M\right) \longrightarrow H^{i-1}\left(v_{1}, \ldots, v_{j+1} ; M\right)(+1) \\
\xrightarrow{y_{j+1}} H^{i}\left(v_{1}, \ldots, v_{j+1} ; M\right) \longrightarrow H^{i}\left(v_{1}, \ldots, v_{j} ; M\right) \longrightarrow \ldots
\end{gathered}
$$

Here $\alpha_{i}$ is induced by $\iota, \beta_{i}$ by $\tau$. For a cycle $z=g_{0}+g_{1} x_{j+1}+\ldots+g_{i-1} x_{j+1}^{(i-1)}$ in $C_{i-1}\left(v_{1}, \ldots, v_{j+1} ; M\right)$ one has $\delta_{i-1}([z])=\left[g_{0} v_{j+1}\right]$.

Corollary 2.4. Let $\mathbf{v}=v_{1}, \ldots, v_{n}$ be a basis for $E_{1}$. The Cartan complex $C \bullet(\mathbf{v} ; E)$ is a free resolution of the residue class field $K$ of $E$. In particular for all $M \in \mathcal{M}$,

$$
\operatorname{Tor}_{i}^{E}(K, M) \cong H_{i}(\mathbf{v} ; M), \quad \operatorname{Ext}_{E}^{i}(K, M) \cong H^{i}(\mathbf{v} ; M)
$$

as graded modules.

Proof. Use the exact sequences of 2.3 to show that $C_{\bullet}(\mathbf{v} ; E)$ is a free resolution of $K$. The other statements follow then immediately.

## 3. Distinguished Pairs

This section describes the behavior of the so called distinguished pairs introduced by Aramova and Herzog [3]. Let $M \in \mathcal{M}$ and $\mathbf{v}=v_{1}, \ldots, v_{n}$ be a basis for $E_{1}$. Consider the long exact homology sequence 2.3

$$
\begin{gathered}
\ldots \longrightarrow H_{i}\left(v_{1}, \ldots, v_{j-1} ; M\right) \longrightarrow H_{i}\left(v_{1}, \ldots, v_{j} ; M\right) \longrightarrow H_{i-1}\left(v_{1}, \ldots, v_{j} ; M\right)(-1) \\
\longrightarrow H_{i-1}\left(v_{1}, \ldots, v_{j-1} ; M\right) \longrightarrow H_{i-1}\left(v_{1}, \ldots, v_{j} ; M\right) \longrightarrow \ldots
\end{gathered}
$$

To simplify the notation we set: $H_{i}(k)=H_{i}\left(v_{1}, \ldots, v_{k} ; M\right)$ for $i>0$ and $H_{0}(k)=$ $\left(0:_{M /\left(v_{1}, \ldots, v_{k-1}\right) M} v_{k}\right) / v_{k}\left(M /\left(v_{1}, \ldots, v_{k-1}\right) M\right)$, where $\left(0:_{W} e\right)=\{a \in W: e a=0\}$ for an $E$-module $W$ and $e \in E$. Let $H_{i}(0)=0$ for $i>0$. Notice that $H_{0}(k)$ is not the 0 th Cartan homology of $M$ with respect to $v_{1}, \ldots, v_{k}$. We obtain the exact sequence

$$
\ldots \longrightarrow H_{1}(j-1) \longrightarrow H_{1}(j) \longrightarrow H_{0}(j)(-1) \longrightarrow 0
$$

The following lemma leads to the concept of distinguished pairs [3, 9.5]

Lemma 3.1. Let $1 \leq l \leq n, j \in \mathbb{N}$. The following statements are equivalent:
(a) (1) $H_{0}(k)_{j}=0$ for $k<l$ and $H_{0}(l)_{j} \neq 0$,
(2) $H_{0}(k)_{j^{\prime}}=0$ for all $j^{\prime}>j$ and all $k \leq l+j-j^{\prime}$.
(b) For all $i \geq 0$
(1) $H_{i}(k)_{i+j}=0$ for $k<l$ and $H_{i}(l)_{i+j} \neq 0$,
(2) $H_{i}(k)_{i+j^{\prime}}=0$ for all $j^{\prime}>j$ and all $k \leq l+j-j^{\prime}$.
(c) Condition (b) is satisfied for some $i$.

Moreover, if the equivalent conditions hold, then $H_{i}(l)_{i+j} \cong H_{0}(l)_{j}$ for all $i \geq 0$.

Definition 3.2. A pair of numbers $(l, j)$ satisfying the equivalent conditions of 3.1 will be called a homological distinguished pair (for $M$ ).

Next we give a similar definition of distinguished pairs for the Cartan cohomology. Consider the long exact cohomology sequence

$$
\begin{gathered}
\ldots \longrightarrow H^{i-1}\left(v_{1}, \ldots, v_{j} ; M\right) \longrightarrow H^{i-1}\left(v_{1}, \ldots, v_{j-1} ; M\right) \longrightarrow H^{i-1}\left(v_{1}, \ldots, v_{j} ; M\right)(+1) \\
\longrightarrow H^{i}\left(v_{1}, \ldots, v_{j} ; M\right) \longrightarrow H^{i}\left(v_{1}, \ldots, v_{j-1} ; M\right) \longrightarrow \ldots
\end{gathered}
$$

We define

$$
\begin{aligned}
& \left.H^{0}(k)=\left(0:_{(0: M}\left(v_{1}, \ldots, v_{k-1}\right)\right) v_{k}\right) / v_{k}\left(0:_{M}\left(v_{1}, \ldots, v_{k-1}\right)\right) \quad \text { and } \\
& H^{i}(k)=H^{i}\left(v_{1}, \ldots, v_{k} ; M\right) \text { for } i>0
\end{aligned}
$$

Furthermore we set $H^{i}(0)=0$ for $i>0$. Notice that $H^{0}(k)$ is not the 0th Cartan cohomology of $M$ with respect to $v_{1}, \ldots, v_{k}$. We obtain the exact sequence

$$
0 \longrightarrow H^{0}(j)(+1) \longrightarrow H^{1}(j) \longrightarrow H^{1}(j-1) \longrightarrow \ldots
$$

There is a result similar to 3.1

Lemma 3.3. Let $1 \leq l \leq n, j \in \mathbb{N}$. The following statements are equivalent:
(a) (1) $H^{0}(k)_{j}=0$ for $k<l$ and $H^{0}(l)_{j} \neq 0$,
(2) $H^{0}(k)_{j^{\prime}}=0$ for all $j^{\prime}<j$ and all $k \leq l+j^{\prime}-j$.
(b) For all $i \geq 0$
(1) $H^{i}(k)_{-i+j}=0$ for $k<l$ and $H^{i}(l)_{-i+j} \neq 0$,
(2) $H^{i}(k)_{-i+j^{\prime}}=0$ for all $j^{\prime}<j$ and all $k \leq l+j^{\prime}-j$.
(c) Condition (b) is satisfied for some $i$.

Moreover, if the equivalent conditions hold, then $H^{i}(l)_{-i+j} \cong H^{0}(l)_{j}$ for all $i \geq 0$.
Proof. The proof is analog to the proof of [3, 9.5].

Definition 3.4. A pair of numbers $(l, j)$ satisfying the equivalent conditions of 3.3 will be called a cohomological distinguished pair (for $M$ ).

As a first corollary we get.

Corollary 3.5. Let $M \in \mathcal{M}$. The following statements are equivalent:
(a) $(l, j)$ is a homological distinguished pair for $M$,
(b) $(l, n-j)$ is a cohomological distinguished pair for $M^{*}$.

Moreover, if the equivalent conditions hold, then $H_{i}(l ; M)_{i+j} \cong H^{i}\left(l ; M^{*}\right)_{-i+n-j}$ for all $i$.

Proof. Let $\mathbf{v} \subseteq E_{1}$ be a sequence of elements. Then by by $2.2 H_{i}(\mathbf{v} ; M)_{i+j} \cong$ $\left(H_{i}(\mathbf{v} ; M)_{i+j}\right)^{\vee} \cong\left(H_{i}(\mathbf{v} ; M)^{*}\right)_{n-i-j} \cong H^{i}\left(\mathbf{v} ; M^{*}\right)_{-i+n-j}$. The claim follows directly from the definitions 3.2 and 3.4.

We set $M_{\langle k\rangle}=\left(0:_{M}\left(v_{1}, \ldots, v_{k}\right)\right)$ and $M^{\langle k\rangle}=M /\left(v_{1}, \ldots, v_{k}\right) M$. We shall need the following two technical lemmata.

Lemma 3.6. (a) For all there exists a natural graded E-module homomorphism

$$
\alpha(t):\left(0:_{M^{\langle t-1\rangle}} v_{t}\right) \longrightarrow\left(0:_{M}\left(v_{1}, \ldots, v_{t}\right)\right)(t-1)
$$

(b) Suppose that for some $t$ and $j$ one has

$$
H_{0}(k)_{j}=0 \text { for } k<t, \quad H_{0}(k)_{j^{\prime}}=0 \text { for all } j^{\prime}>j \text { and all } k \leq t+j-j^{\prime}
$$

Then

$$
\alpha(t)_{j}:\left(0:_{M^{\langle t-1\rangle}} v_{t}\right)_{j} \longrightarrow\left(0:_{M}\left(v_{1}, \ldots, v_{t}\right)\right)_{j+t-1}
$$

is bijective and

$$
\alpha(t)_{j+1}:\left(0:_{M^{\langle t-1\rangle}} v_{t}\right)_{j+1} \longrightarrow\left(0:_{M}\left(v_{1}, \ldots, v_{t}\right)\right)_{j+t}
$$

is injective.

Proof. (a) We prove the existence of $\alpha(t):\left(0:_{M^{\langle t-1\rangle}} v_{t}\right) \rightarrow\left(0 \quad:_{M}\right.$ $\left.\left(v_{1}, \ldots, v_{t}\right)\right)(t-1)$ by induction on $t$. For $t=1$ there is nothing to show. Now let $t>1$ and consider the composition $\beta$ of graded $E$-module homomorphisms
$M^{\langle t-1\rangle} \xrightarrow{\beta_{1}} \frac{M^{\langle t-2\rangle}}{v_{t-1} M^{\langle t-2\rangle}} \xrightarrow{\beta_{2}} \frac{M^{\langle t-2\rangle}}{\left(0:_{M^{\langle t-2\rangle}} v_{t-1}\right)} \xrightarrow{\beta_{3}}\left(v_{t-1} M^{\langle t-2\rangle}\right)(+1) \xrightarrow{\beta_{4}}\left(0:_{M^{\langle t-2\rangle}} v_{t-1}\right)(+1)$
Here the $\beta_{i}$ are defined as follows: by the definition of $M^{\langle t-1\rangle}$ we see that there is a natural graded $E$-module isomorphism $\beta_{1}$. Now consider $v_{t-1} M^{\langle t-2\rangle} \subseteq\left(0:_{M^{\langle t-2\rangle}}\right.$ $\left.v_{t-1}\right)$. It follows that there is a natural graded surjective $E$-module homomorphism $\beta_{2}$ and a natural graded injective $E$-module homomorphism $\beta_{4}$. Furthermore $\beta_{3}$ is the natural graded $E$-module isomorphism.
The following diagram is commutative since $\beta$ is an $E$-module homomorphism

and therefore induces a natural graded $E$-module homomorphism between the two kernel of the multiplication homomorphisms with $v_{t}$ :

$$
\begin{equation*}
\alpha_{1}:\left(0:_{M^{\langle t-1\rangle}} v_{t}\right) \longrightarrow\left(0:_{M^{\langle t-2\rangle}}\left(v_{t-1}, v_{t}\right)\right)(+1) \tag{1}
\end{equation*}
$$

By our induction hypothesis for $t-1$, we get a natural graded $E$-module homomorphism $\alpha(t-1):\left(0:_{M^{\langle t-2\rangle}} v_{t-1}\right) \rightarrow\left(0:_{M}\left(v_{1}, \ldots, v_{t-1}\right)\right)(t-2)$, and the following diagram is commutative

$$
\begin{gathered}
\left(0:_{M^{\langle t-2\rangle}} v_{t-1}\right) \xrightarrow{v_{t}} \xrightarrow{\alpha(t-1)} \downarrow \\
\left.\left(0:_{M}\left(v_{1}, \ldots, v_{t-1}\right)\right)(t-2) \xrightarrow{v_{t}}{ }^{\alpha(t-2\rangle} v_{t-1}\right) \\
\left(0:_{M}\left(v_{1}, \ldots, v_{t-1}\right)\right)(t-2)
\end{gathered} .
$$

Thus we get a graded $E$-module homomorphism between the two kernel of the multiplication homomorphisms:

$$
\begin{equation*}
\alpha_{2}:\left(0:_{M^{\langle t-2\rangle}}\left(v_{t-1}, v_{t}\right)\right) \longrightarrow\left(0:_{M}\left(v_{1}, \ldots, v_{t}\right)\right)(t-2) . \tag{2}
\end{equation*}
$$

We define the natural graded $E$-module homomorphism $\alpha(t):\left(0:_{M^{\langle t-1\rangle}} v_{t}\right) \rightarrow\left(0:_{M}\right.$ $\left.\left(v_{1}, \ldots, v_{t}\right)\right)(t-1)$ as the composition of the maps (1) and (2).
(b) This is again proved by induction on $t$. For $t=1$ there is nothing to show. So let $t>1$ and $j$, where

$$
H_{0}(k)_{j}=0 \text { for } k<t, H_{0}(k)_{j^{\prime}}=0 \text { for all } j^{\prime}>j \text { and all } k \leq t+j-j^{\prime}
$$

Then for $t-1$ and $j+1$ we see that

$$
\begin{aligned}
& H_{0}(k)_{j+1}=0 \text { for } k<t-1 \\
& H_{0}(k)_{j^{\prime}}=0 \text { for all } j^{\prime}>j+1 \text { and all } k \leq t-1+j+1-j^{\prime}
\end{aligned}
$$

By the induction hypothesis $\alpha(t-1)$ is an isomorphism in degree $j+1$ :

$$
\begin{equation*}
\alpha(t-1)_{j+1}:\left(0:_{M^{\langle t-2\rangle}} v_{t-1}\right)_{j+1} \xrightarrow{\sim}\left(0:_{M}\left(v_{1}, \ldots, v_{t-1}\right)\right)_{j+t-1} \tag{3}
\end{equation*}
$$

and $\alpha(t-1)$ is injective in degree $j+2$

$$
\begin{equation*}
\alpha(t-1)_{j+2}:\left(0:_{M^{\langle t-2\rangle}} v_{t-1}\right)_{j+2} \longrightarrow\left(0:_{M}\left(v_{1}, \ldots, v_{t-1}\right)\right)_{j+t} \tag{4}
\end{equation*}
$$

Now consider for $t$ the condition: $H_{0}(t-1)_{j}=H_{0}(t-1)_{j+1}=0$. This is equivalent to

$$
\begin{equation*}
\left(0:_{M^{\langle t-2\rangle}} v_{t-1}\right)_{j}=v_{t-1}\left(M^{\langle t-2\rangle}\right)_{j-1} \tag{5}
\end{equation*}
$$

and

$$
\begin{equation*}
\left(0:_{M^{\langle t-2\rangle}} v_{t-1}\right)_{j+1}=v_{t-1}\left(M^{\langle t-2\rangle}\right)_{j} \tag{6}
\end{equation*}
$$

With the decomposition of the $E$-module homomorphism $\beta$ in (a) it follows for the pair $(t, j)$ :
From (5) and (6) we see that $\beta_{2}$ is bijective in degree $j$ and $j+1$. From (6) we get that the map $\beta_{4}$ is bijective in degree $j$. Thus it follows that in this case (1) $\left(0:_{M^{\langle t-1\rangle}} v_{t}\right)_{j} \rightarrow\left(0:_{M^{\langle t-2\rangle}}\left(v_{t-1}, v_{t}\right)\right)_{j+1}$ is bijective. From (3) we see that (2) $\left(0:_{M^{\langle t-2\rangle}}\left(v_{t-1}, v_{t}\right)\right)_{j+1} \rightarrow\left(0:_{M}\left(v_{1}, \ldots, v_{t}\right)\right)_{j+t-1}$ is bijective. Therefore the composition $\alpha(t)_{j}:\left(0:_{M^{\langle t-1\rangle}} v_{t}\right)_{j} \rightarrow\left(0:_{M}\left(v_{1}, \ldots, v_{t}\right)\right)_{j+t-1}$ is bijective.
Similar we get for the pair $(t, j+1)$ that

$$
\alpha(t)_{j+1}:\left(0:_{M^{\langle t-1\rangle}} v_{t}\right)_{j+1} \longrightarrow\left(0:_{M}\left(v_{1}, \ldots, v_{t}\right)\right)_{j+t}
$$

is injective.

Lemma 3.7. Suppose that for some $t$ and $j$ one has

$$
H_{0}(k)_{j}=0 \text { for } k<t, H_{0}(k)_{j^{\prime}}=0 \text { for all } j^{\prime}>j \text { and all } k \leq t+j-j^{\prime}
$$

Then it follows that $H_{0}(t)_{j} \cong H^{0}(t)_{j+t-1}$.

Proof. We see the following: in the proof of 3.6 we defined a natural graded $E$ module homomorphism $\beta: M^{\langle t-1\rangle} \rightarrow\left(0:_{M^{\langle t-2\rangle}} v_{t-1}\right)(+1)$. With the condition $0=$ $H_{0}(t-1)_{j}$ for the pair $(t, j)$ we get $v_{t-1}\left(M^{\langle t-2\rangle}\right)_{j-1} \cong\left(0:_{M^{\langle t-2\rangle}} v_{t-1}\right)_{j}$. We see that $\beta$ is surjective in degree $j-1$, because $\beta_{4}$ is an isomorphism in degree $j-1$. The pair $(t-1, j)$ satisfies the assumption of 3.6 (b) and it follows that $\left(0:_{M^{\langle t-2\rangle}} v_{t-1}\right)_{j} \cong$ $\left(0:_{M}\left(v_{1}, \ldots, v_{t-1}\right)\right)_{j+t-2}$. Therefore the composition

$$
\psi:\left(M^{\langle t-1\rangle}\right)_{j-1} \longrightarrow\left(0:_{M}\left(v_{1}, \ldots, v_{t-1}\right)\right)_{j+t-2}
$$

is surjective.
Now there exists the commutative diagram

The $K$-linear map $\psi$ is surjective (see above) and the $K$-linear map $\varphi$ is the $E$-module homomorphism $\alpha(t)$ in degree $j-1$ (see 3.6 (a)). Furthermore

$$
\left(0:_{M^{\langle t-1\rangle}} v_{t}\right)=\operatorname{Ker}\left(M^{\langle t-1\rangle} \xrightarrow{v_{t}} v_{t}\left(M^{\langle t-1\rangle}\right)\right)
$$

and

$$
\left(0:_{M}\left(v_{1}, \ldots, v_{t}\right)\right)=\operatorname{Ker}\left(\left(0:_{M}\left(v_{1}, \ldots, v_{t-1}\right)\right) \xrightarrow{v_{t}} v_{t}\left(0:_{M}\left(v_{1}, \ldots, v_{t-1}\right)\right)\right) .
$$

It follows that the induced $K$-linear map between the cokernel

$$
\gamma: v_{t}\left(M^{\langle t-1\rangle}\right)_{j-1} \longrightarrow v_{t}\left(0:_{M}\left(v_{1}, \ldots, v_{t-1}\right)\right)_{j+t-2}=v_{t}\left(M_{\langle t-1\rangle}\right)_{j+t-2}
$$

is surjective. Now consider the commutative diagram

where $\gamma$ is the induced map. Since the pair $(t, j)$ satisfies the assumption of 3.6 (b) we get that $\alpha(t)$ is bijective in degree $j$. Now we see that a bijective $K$-linear map

$$
H_{0}(t)_{j} \cong H^{0}(t)_{j+t-1}
$$

is induced and therefore the claim of this lemma follows.

We are able to prove the main theorem
Theorem 3.8. Let $M \in \mathcal{M}$. The following statements are equivalent:
(a) $(l, j)$ is a homological distinguished pair for $M$,
(b) $(l, j+l-1)$ is a cohomological distinguished pair for $M$.

Moreover, if the equivalent conditions hold, then $H_{i}(l)_{i+j} \cong H^{i}(l)_{-i+j+l-1}$ for all $i$.
Proof. $\quad(\mathrm{a}) \Longrightarrow(\mathrm{b})$ : We show condition 3.3 (a). Let $(l, j)$ be a homological distinguished pair for $M$. We get

$$
\begin{equation*}
H_{0}(k)_{j}=0 \text { for } k<l \text { and } H_{0}(l)_{j} \neq 0 \tag{7}
\end{equation*}
$$

and

$$
\begin{equation*}
H_{0}(k)_{j^{\prime}}=0 \text { for all } j^{\prime}>j \text { and all } k \leq l+j-j^{\prime} \tag{8}
\end{equation*}
$$

For $k \leq l$ and $j$ we see that

$$
H_{0}(s)_{j}=0 \text { for } s<k, H_{0}(s)_{j^{\prime}}=0 \text { for all } j^{\prime}>j \text { and all } s \leq k+j-j^{\prime}
$$

For $k \leq l+j-j^{\prime}$ and $j^{\prime}>j$ we have

$$
H_{0}(s)_{j^{\prime}}=0 \text { for } s<k, H_{0}(s)_{j^{\prime \prime}}=0 \text { for all } j^{\prime \prime}>j^{\prime} \text { and all } s \leq k+j^{\prime}-j^{\prime \prime}
$$

Using 3.7 it follows that

$$
\begin{equation*}
H_{0}(k)_{j} \cong H^{0}(k)_{j+k-1}, \tag{9}
\end{equation*}
$$

and

$$
\begin{equation*}
H_{0}(k)_{j^{\prime}} \cong H^{0}(k)_{j^{\prime}+k-1} \tag{10}
\end{equation*}
$$

for the pairs $(k, j)$ and $\left(k, j^{\prime}\right)$.
To prove that $(l, j+l-1)$ is a cohomological distinguished pair for $M$ we must show that

$$
\begin{equation*}
H^{0}(k)_{j+l-1}=0 \text { for } k<l \quad \text { and } \quad H^{0}(l)_{j+l-1} \neq 0 \tag{11}
\end{equation*}
$$

and

$$
\begin{equation*}
H^{0}(k)_{j^{\prime}}=0 \text { for all } j^{\prime}<j+l-1 \text { and all } k \leq l+j^{\prime}-(j+l-1) \tag{12}
\end{equation*}
$$

First we prove (11). For $k=l$ and $j+l-1$ it follows from (7) and (9) that

$$
H^{0}(l)_{j+l-1} \cong H_{0}(l)_{j} \neq 0
$$

For $k<l$ and $j+l-1$ it follows from (8) and (10) that

$$
H^{0}(k)_{j+l-1} \cong H_{0}(k)_{j+l-k}=0
$$

because $j^{\prime}=j+l-k>j$ and $k \leq l+j-(j+l-k)=l+j-j^{\prime}$.
Finally we prove (12). Let $j^{\prime}<j+l-1$ and $k \leq l+j^{\prime}-(j+l-1)$. We can write $j^{\prime}=j+l-1-t$, where $t=1, \ldots, j+l-1$ and therefore $k \leq l-t$.
Now let $k=l-t$. It follows from (7) and (9) that

$$
H^{0}(k)_{j+l-1-t} \cong H_{0}(k)_{j+l-k-t}=0
$$

because $j^{\prime \prime}=j+l-k-t=j$ and $k=l-t<l$. For $k<l-t$ it follows from (8) and (10) that

$$
H^{0}(k)_{j+l-1-t} \cong H_{0}(k)_{j+l-k-t}=0
$$

because $j^{\prime \prime}=j+l-k-t>j$ and $k<k+t=l+j-(j+l-k-t)=l+j-j^{\prime \prime}$. Altogether we get that $(l, j+l-1)$ is a cohomological distinguished pair for $M$.
(b) $\Longrightarrow($ a): Let $(l, j+l-1)$ be a cohomological distinguished pair for $M$. The results of 3.5 and 3.8 imply that $(l, j)$ is a homological distinguished pair for $M$.
The claim $H_{i}(l)_{i+j} \cong H^{i}(l)_{-i+j+l-1}$ follows also from 3.5 and 3.8.
To avoid confusion we now set $H_{i}(l ; W)$ for $H_{i}(l)$ to indicate that the homology is taken with values in $W$.

Corollary 3.9. Let $M \in \mathcal{M}$. The following statements are equivalent:
(a) $(l, j)$ is a homological distinguished pair for $M$,
(b) $(l, n-j-l+1)$ is a homological distinguished pair for $M^{*}$.

Moreover, if the equivalent conditions hold, then $H_{i}(l ; M)_{i+j} \cong H_{i}\left(l ; M^{*}\right)_{i+n-j-l+1}$ for all $i$.

Proof. This follows from 3.5 and 3.8.

## 4. Applications

In this section we extend a theorem of Bayer, Charalambous and S. Popescu on extremal Betti numbers to squarefree $S$-modules.

We quote the following result of [3]
Proposition 4.1. Let $M \in \mathcal{M}$ and $j \in \mathbb{Z}$. The formal power series $P_{j}(t)=$ $\sum_{i \geq 0} \beta_{i, i+j}^{E}(M) t^{i}$ is the Hilbert series of a graded $K\left[y_{1}, \ldots, y_{n}\right]$-module. In particular there exists a polynomial $Q_{j}(t) \in \mathbb{Z}[t]$ and an integer $d_{j} \in \mathbb{N}$ with $d_{j} \leq n$ such that

$$
P_{j}(t)=\frac{Q_{j}(t)}{(1-t)^{d_{j}}} \quad \text { and } \quad e_{j}:=Q_{j}(1) \neq 0
$$

Let $N \in \mathcal{S} \mathcal{Q}(S), k(j)=\max \left\{k: \beta_{k, k+j}^{S}(N) \neq 0\right\}$ and $P_{j}(t)=\sum_{i \geq 0} \beta_{i, i+j}^{E}\left(N_{E}\right) t^{i}$. Then 1.3 yields

$$
\begin{equation*}
P_{j}(t)=\frac{\sum_{k=0}^{k(j)} \beta_{k, k+j}^{S}(N) t^{k}(1-t)^{k(j)-k}}{(1-t)^{k(j)+j}} \tag{13}
\end{equation*}
$$

As in [3, 9.2, 9.3] we conclude

Proposition 4.2. For $j \in \mathbb{N}$ and $N \in \mathcal{S Q}(S)$ we have $d_{j}\left(N_{E}\right)=k(j)+j$ and $e_{j}\left(N_{E}\right)=\beta_{k(j), k(j)+j}^{S}(N)$.

Let $M \in \mathcal{M}$; as shown in [3] there exists a basis $\mathbf{v}$ of $E_{1}$ and an integer $i \gg 0$ such that $d_{j}(M)=n+1-\min \left\{k: H_{i}(k, M)_{i+j} \neq 0\right\}$ and $e_{j}(M)=\operatorname{dim}_{K} H_{i}\left(n-d_{j}+\right.$ $1, M)_{i+j}$, where $H_{i}(k, M)=H_{i}\left(v_{1} \ldots, v_{k} ; M\right)$ for all $k$. Thus if $(l, j)$ is a homological distinguished pair for $M$, we have

$$
d_{j}(M)=n+1-l \quad \text { and } \quad e_{j}(M)=\operatorname{dim}_{K} H_{i}(l, M)_{i+j}
$$

Therefore 3.9 implies

Corollary 4.3. Let $M \in \mathcal{M}$. If $(l, j)$ is a homological distinguished pair for $M$ then $d_{j}(M)=d_{n-j-l+1}\left(M^{*}\right)$ and $e_{j}(N)=e_{n-j-l+1}\left(M^{*}\right)$.

The definition of an extremal Betti number together with (13) imply

Corollary 4.4. Let $N \in \mathcal{S} \mathcal{Q}(S)$. The following statements are equivalent:
(a) $\beta_{i, i+j}^{S}(N)$ is an extremal Betti number of $N$,
(b) $i=k(j)$ and $d_{j^{\prime}}\left(N_{E}\right)-d_{j}\left(N_{E}\right)<j^{\prime}-j$ for all $j^{\prime}>j$.

Now we get

Corollary 4.5. Let $N \in \mathcal{S} \mathcal{Q}(S)$. The following statements are equivalent:
(a) $\beta_{i, i+j}^{S}(N)$ is an extremal Betti number of $N$,
(b) $(n+1-i-j, j)$ is a homological distinguished pair for $N_{E}$.

Moreover, if the equivalent conditions hold, then $\beta_{i, i+j}^{S}(N)=\operatorname{dim}_{K} H_{0}(n+1-i-j)_{j}$.

Combining 4.5, 3.9 and 1.8 we get

Theorem 4.6. Let $N \in \mathcal{S Q}(S)$. The following statements are equivalent:
(a) $\beta_{i, i+j}^{S}(N)$ is an extremal Betti number of $N$,
(b) $\beta_{j, j+i}^{S}\left(N^{*}\right)$ is an extremal Betti number of $N^{*}$.

Moreover, if the equivalent conditions hold, then $\beta_{i, i+j}^{S}(N)=\beta_{j, j+i}^{S}\left(N^{*}\right)$.
In particular we have
Corollary 4.7. Let $\Gamma \subseteq \Delta$ be simplicial complexes on the vertex set $[n], K a$ field. Let $I_{\Delta} \subseteq I_{\Gamma} \subseteq S=K\left[x_{1}, \ldots, x_{n}\right]$ be the corresponding ideals in the polynomial ring. The following statements are equivalent:
(a) $\beta_{i, i+j}^{S}\left(I_{\Gamma} / I_{\Delta}\right)$ is an extremal Betti number of $I_{\Gamma} / I_{\Delta}$,
(b) $\beta_{j, j+i}^{S}\left(I_{\Delta^{*}} / I_{\Gamma^{*}}\right)$ is an extremal Betti number of $I_{\Delta^{*}} / I_{\Gamma^{*}}$.

Moreover, if the equivalent conditions hold, then $\beta_{i, i+j}^{S}\left(I_{\Gamma} / I_{\Delta}\right)=\beta_{j, j+i}^{S}\left(I_{\Delta^{*}} / I_{\Gamma^{*}}\right)$.
In the case $\Gamma=\emptyset$ this is a result in [4].
