# SOME TRANSFORMATIONS ON $K$-CONTACT AND NORMAL CONTACT RIEMANNIAN MANIFOLDS 

TAKASHI SAKai

(Received February 3, 1966)

1. Introduction. In [3] and [5], infinitesimal transformations on $K$-contact and normal contact Riemannian manifolds were studied, and global transformations on almost contact and contact Riemannian manifolds were discussed in [4]. In this note, we shall add some results concerning global transformations on $K$-contact and normal contact Riemannian manifolds. In §2, some preliminary notions and identities are given for later use. In §3, it will be shown that homothetic and affine transformations on $K$-contact Riemannian manifolds must be isometries. In §4, transformations on $\eta$-Einstein manifolds will be concerned. The author wishes to thank Professor Sasaki and Mr. Tanno for their suggestions and kind advices.
2. Preliminaries ([1], [2]). Let $M$ be an $n(=2 m+1, m \geqq 1)$ dimensional $C^{\infty}$-manifold with a contact structure $\eta$. We take an arbitrary point $x$ and a local coordinate system $\left(x^{k}, U\right)$ around $x$. If we put $2 \phi_{j i}=\partial_{j} \boldsymbol{\eta}_{i}-\partial_{i} \eta_{j}$, there exists a Riemannian metric $g_{j i}$ in $M$ such that $\phi_{i}^{h}=g^{h r} \phi_{i r}$ and $\xi^{i}=g^{i r} \eta_{r}$ define a $(\phi, \xi, \eta, g)$-structure with $\eta_{i}$ and $g_{j i}$. That is,

$$
\begin{align*}
& \xi^{i} \eta_{i}=1, \quad \operatorname{rank}\left(\phi_{j}^{i}\right)=n-1, \\
& \phi_{j}^{i} \xi^{j}=0, \quad \phi_{j}^{i} \phi_{k}^{j}=-\delta_{k}^{i}+\xi^{i} \eta_{k},  \tag{1.1}\\
& g_{j i} \xi^{i}=\eta_{j}, \quad g_{j i} \phi_{k}^{j} \phi_{h}^{i}=g_{k h}-\eta_{k} \eta_{h}
\end{align*}
$$

hold good. This structure is called a contact metric structure, and the manifold with this structure is called a contact Riemannian manifold. If we define,

$$
\begin{equation*}
\phi^{k h}=g^{k r} \boldsymbol{\phi}_{r}^{h}=g^{k i} g^{h r} \phi_{i r} \tag{1.2}
\end{equation*}
$$

this is a skew-symmetric contravariant tensor.
For a contact Riemannian manifold, torsion tensor fields $N_{j i}{ }^{h}$ and $N_{j}^{i}$ can be defined. The condition $N_{j}^{i}=0$ is equivalent to the fact that $\xi^{i}$ is a Killing
vector, and the contact Riemannian manifold which satisfies this condition is called a $K$-contact Riemannian manifold. In a $K$-contact Riemannian manifold,

$$
\begin{equation*}
\nabla_{j} \boldsymbol{\eta}_{i}=\boldsymbol{\phi}_{j i}, \tag{1.3}
\end{equation*}
$$

$$
\begin{equation*}
\nabla_{k} \phi_{j i}+R_{i j k}^{r} \eta_{r}=0 \tag{1.4}
\end{equation*}
$$

$$
\begin{equation*}
R_{k j i}{ }^{h} \xi^{k} \xi^{i}=\eta_{j} \xi^{h}-\delta_{j}^{h}, \quad R_{k j i h} \xi^{k} \xi^{h}=g_{j i}-\eta_{j} \eta_{i} \tag{1.5}
\end{equation*}
$$

hold good, where $R_{k j i}{ }^{h}$ is the curvature tensor.
On the other hand, the contact Riemannian manifold which satisfies $N_{j i}{ }^{h}=0$ is called a normal contact Riemannian manifold. It is known that a normal contact Riemannian manifold is $K$-contact. In this case, we have

$$
\begin{align*}
& \nabla_{k} \phi_{j i}=\eta_{j} g_{k i}-\eta_{i} g_{k j},  \tag{1.6}\\
& \xi^{k} R_{k j i}^{r}=\xi^{r} g_{j i}-\eta_{i} \delta_{j}^{r}, \quad R_{k j i}^{r} \eta_{r}=\eta_{k} g_{j i}-\eta_{j} g_{k i},  \tag{1.7}\\
& \phi_{j}^{r} R_{r}^{l}+(1 / 2) \phi^{r k} R_{r k j}^{l}=(n-2) \phi_{j}^{l}, \tag{1.8}
\end{align*}
$$

where we have put

$$
R_{j i}=R_{r j i}^{r} \quad \text { and } \quad R_{l}^{r}=g^{r s} R_{s l}
$$

Now, $K$-contact Riemannian manifold ( $m>1$ ) in which Ricci's tensor takes the form

$$
\begin{equation*}
R_{j i}=a g_{j i}+b \eta_{j} \eta_{i} \tag{1.9}
\end{equation*}
$$

is called a $K$-contact $\eta$-Einstein manifold, where $a$ and $b$ become constants. Then,

$$
\begin{equation*}
a+b=n-1 \tag{1.10}
\end{equation*}
$$

holds good and in a normal contact $\eta$-Einstein manifold, we get

$$
\begin{equation*}
\frac{1}{2} \phi^{r k} R_{r k j}^{i}=(b-1) \phi_{j}^{i} . \tag{1.11}
\end{equation*}
$$

In the sequel we will be concerned with differentiable transformations on $M$. These transformations induce algebra automorphisms of algebra over real numbers of all tensor fields defined on $M$, and they preserve types and commute with contractions. The notation 'bar' will be used to denote the geometric objects which are transformed by the induced transformation.

By the automorphism of a contact Riemannian manifold $M$, we mean the transformation of $M$ which leaves invariant $\phi_{j}^{i}, \xi^{i}, \eta_{i}$, and $g_{j i}$ of $(\phi, \xi, \eta, g)$ structure.

## 3. Transformations on $K$-contact Riemannian manifolds.

PROPOSITION 1. ([4]). In a contact Riemannian manifold $M$, any conformal transformation $\mu$ which is also a contact transformation is an isometry, and if $\bar{\eta}(\xi)>0$ holds, $\mu$ is an automorphism.

Proof. By definition we can write $\bar{g}_{j i}=\rho g_{j i}, \bar{g}^{j i}=(1 / \rho) g^{j i}$, and $\bar{\eta}_{j}=\sigma \eta_{j}$ for some positive scalar $\rho$ and scalar $\sigma$. By $(1.1)_{5} \bar{\xi}^{i}=(\sigma / \rho) \xi^{i}$ holds good. Contracting both sides of $\bar{\phi}_{j i}=\sigma \phi_{j i}+(1 / 2)\left(\partial_{j} \sigma \cdot \eta_{i}-\partial_{i} \sigma \cdot \eta_{j}\right)$ with $\xi^{i}$, we know that $\bar{\phi}_{j i}=\sigma \phi_{j i}$ and consequently $\bar{\phi}_{j}^{i}=(\sigma / \rho) \phi_{j}^{i}$ is true. Now we have $\sigma^{2}=\rho^{2}=\rho=1$ by $(1.1)_{4}$.
Q.E.D.

Theorem 1. In a $K$-contact Riemannian manifold $M$, any homothetic transformation $\mu$ is an isometry.

Proof. We can write $\bar{g}_{j i}=\rho g_{j i}$, and $\bar{g}^{j i}=(1 / \rho) g^{j i}$ where $\rho$ is a positive constant. Because a homothetic transformation is an affine transformation, we have

$$
\begin{equation*}
\rho R_{k j i h} \bar{\xi}^{k} \bar{\xi}^{h}=\rho g_{j i}-\bar{\eta}_{j} \bar{\eta}_{i} \tag{2.1}
\end{equation*}
$$

by (1.5). Transvecting (2.1) with $\xi^{j} \xi^{2}$, we get

$$
\begin{equation*}
\rho\left(g_{k h}-\eta_{k} \eta_{h}\right) \bar{\xi}^{k} \bar{\xi}^{h}=\rho-\bar{\eta}_{j} \bar{\eta}_{i} \xi^{j} \xi^{i} . \tag{2.2}
\end{equation*}
$$

But since $g_{k h} \bar{\xi}^{k} \bar{\xi}^{h}=1 / \rho$ and $\eta_{k} \bar{\xi}^{k}=(1 / \rho) \xi^{k} \bar{\eta}_{k}$ hold good, we have

$$
\begin{equation*}
\rho(1-\rho)=(1-\rho)\left(\xi^{r} \bar{\eta}_{r}\right)^{2} . \tag{2.3}
\end{equation*}
$$

So we get $\rho=1$ or $\left(\xi^{r} \bar{\eta}_{r}\right)^{2}=\rho$. In the second case,

$$
\bar{\eta}_{k}=\left(\xi^{r} \bar{\eta}_{r}\right) \eta_{k}-\phi_{k}^{j} \phi_{j}^{h} \bar{\eta}_{h}
$$

is true by $(1.1)_{4}$. Since $\mu$ is a homothetic transformation, we have $\left\|\bar{\eta}_{k}\right\|^{2}$ $=g^{k j} \bar{\eta}_{k} \bar{\eta}_{j}=\rho$. On the other hand, $\left\|\left(\xi^{r} \bar{\eta}_{r}\right) \eta_{k}\right\|^{2}=\left(\xi^{r} \bar{\eta}_{r}\right)^{2}=\rho$ is true and, $\left(\xi^{r} \bar{\eta}_{r}\right) \eta_{k}$ and $\phi_{k}^{j} \phi_{j}^{n} \bar{\eta}_{h}$ are mutually orthogonal, so $\left\|\phi_{k}^{j} \phi_{j}^{n} \bar{\eta}_{h}\right\|=0$ holds good. That is, $\mu$ is a contact transformation. Then by Proposition 1 we know that $\mu$ is isometric.
Q.E.D.

THEOREM 2. In a K-contact Riemannian manifold $M$, any affine transformation $\mu$ is an isometry.

Proof. Since $\mu$ is an affine transformation, by Ricci's identity,

$$
0=\nabla_{l} \nabla_{m} \bar{g}_{i k}-\nabla_{m} \nabla_{l} \bar{g}_{i k}=-R_{l m i}^{a} \bar{g}_{a k}-R_{l m k}^{a} \bar{g}_{a i},
$$

that is,

$$
\begin{equation*}
R_{l m i}^{a} \bar{g}_{a k}+R_{l m k}^{a} \bar{g}_{a i}=0 \tag{2.4}
\end{equation*}
$$

holds good. Transvecting (2.4) with $\xi^{i} \xi^{k} \xi^{l}$, we have by (1.5)

$$
\begin{equation*}
\overline{\boldsymbol{g}}_{k r} \xi^{r}=\left(\xi^{a} \xi^{b} \overline{\boldsymbol{g}}_{a b}\right) \boldsymbol{\eta}_{k} \tag{2.5}
\end{equation*}
$$

Now, transvecting (2.4) with $\xi^{i} \xi^{l}$, we get

$$
\begin{equation*}
\left(\eta_{m} \xi^{a}-\delta_{m}^{a}\right) \bar{g}_{a k}+\xi^{l} R_{l m k}^{a} \xi^{i} \bar{g}_{i a}=0 . \tag{2.6}
\end{equation*}
$$

Substituting (2.5) into (2.6), we obtain

$$
\begin{equation*}
\bar{g}_{m k}=\left(\xi^{a} \xi^{b} \bar{g}_{a b}\right) g_{m k} \tag{2.7}
\end{equation*}
$$

Thus $\mu$ is a conformal transformation. But any affine transformtion which is also a conformal transformation must be homothetic. So Theorem 2 reduces to Theorem 1.
Q.E.D.

Proposition 2.*) In a $K$-contact Riemannian manifold $M$, any projective transformation $\mu$ which is at the same time a contact transformation with constant associated function $\sigma$ is an isometry. Moreover, if $\sigma$ is positive, $\mu$ is an automorphism.

PROOF. Since $\mu$ is a projective transformation, we have

$$
\bar{\Gamma}_{j i}^{k}=\Gamma_{j i}^{k}+p_{j} \delta_{i}^{k}+p_{i} \delta_{j}^{k}
$$

for some covariant vector field $p_{i}$, where $\Gamma_{j i}^{k}$ is Christoffel's symbols. Then,

$$
\begin{equation*}
\bar{\phi}_{i j}=\partial_{i} \bar{\eta}_{j}-\bar{\Gamma}_{i j}^{k} \bar{\eta}_{k}=\sigma \phi_{i j}-\sigma\left(p_{i} \eta_{j}+p_{j} \eta_{i}\right) \tag{2.8}
\end{equation*}
$$

[^0]holds good. Adding to (2.8) the identity which is obtained from (2.8) by permuting $i$ and $j$, we get
\[

$$
\begin{equation*}
p_{i} \boldsymbol{\eta}_{j}+p_{j} \boldsymbol{\eta}_{i}=0 . \tag{2.9}
\end{equation*}
$$

\]

Now transvecting (2.9) with $g^{j i}$ and $\xi^{i}$ respectively, we have $p_{i}=0$. Thus projective transformation which is also a contact transformation with constant associsted function must be an affine transformation. Then Proposition 2 reduces to Theorem 2 and Proposition 1.
Q.E.D.

## 4. Transformations on $\eta$-Einstein manifolds.

Proposition 3. In a $K$-contact $\eta$-Einstein manifold $(b \neq 0, m>1)$, an isometry $\mu$ which satisfies $\bar{\eta}(\xi)>0$ is an automorphism.

PROOF. Since $\bar{R}_{j i}=R_{j i}$ holds good, we have $\bar{\eta}_{i} \bar{\eta}_{j}=\eta_{i} \eta_{j}$. Transvecting this identity with $\xi^{i}$, we know that $\mu$ is a contact transformation. Thus Proposition 3 reduces to Proposition 1.
Q.E.D.

In the sequel we will be concerned with two theorems which are studied in [3] in infinitesimal case.

THEOREM 3. In a normal contact $\eta$-Einstein manifold $M(b \neq 0, m>1)$, any conformal transformation $\mu$ is an isometry, and if it satisfies $\bar{\eta}(\xi)>0, \mu$ is an automorphism.

PROOF. If we put $\bar{g}_{j i}=\rho g_{j i}$, where $\rho$ is a positive scalar, and $\boldsymbol{\tau}=(1 / 2) \log \rho$, then we have

$$
\begin{equation*}
\bar{\Gamma}_{j k}^{i}=\Gamma_{j k}^{i}+\left(\tau_{k} \delta_{j}^{i}+\tau_{j} \delta_{k}^{i}-\tau^{i} g_{j k}\right), \tag{3.1}
\end{equation*}
$$

where $\boldsymbol{\tau}_{k}=\partial_{k} \boldsymbol{\tau}$ and $\boldsymbol{\tau}^{k}=g^{k j} \boldsymbol{\tau}_{j} . \quad$ Next,

$$
\begin{align*}
\bar{R}_{k j i}^{h}=R_{k j i}^{h} & +\delta_{k}^{h} A_{j i}-\delta_{j}^{h} A_{k i}+A_{k}^{h} g_{j i}-A_{j}^{h} g_{k i}  \tag{3.2}\\
& -\left(\delta_{k}^{h} g_{j i}-\delta_{j}^{h} g_{k i}\right) \tau_{r} \tau^{r}
\end{align*}
$$

holds good, where $A_{j i}=\boldsymbol{\tau}_{j} \boldsymbol{\tau}_{i}-\nabla_{j} \boldsymbol{\tau}_{i}$ is symmetric and $A_{k}^{h}=g^{h r} A_{r k}$. In particular, we have

$$
\begin{equation*}
\bar{R}_{j k}=R_{j k}+(n-2) A_{j k}+A_{r}^{r} g_{j k}-(n-1) \tau_{r} \tau^{r} g_{j k} . \tag{3.3}
\end{equation*}
$$

Contracting (3.2) with $\bar{\eta}_{k}$ and using (1.7) we get .
(3.4) $\left(\rho+\boldsymbol{\tau}_{r} \boldsymbol{\tau}^{r}\right)\left(\overline{\boldsymbol{\eta}}_{j} g_{k i}-\overline{\boldsymbol{\eta}}_{k} g_{j i}\right)=-R_{k j i}^{r} \overline{\boldsymbol{\eta}}_{r}+\left(A_{k i} \overline{\boldsymbol{\eta}}_{j}-A_{j i} \overline{\boldsymbol{\eta}}_{k}\right)+\left(A_{j}^{r} g_{k i}-A_{k}^{r} y_{j i}\right) \overline{\boldsymbol{\eta}}_{r}$.

And next (3.5) comes from (1.9) and (3.3).

$$
\begin{equation*}
(n-2) A_{k i}=\left\{a(\rho-1)+(n-1) \tau_{r} \boldsymbol{\tau}^{r}-A_{r}^{r}\right\} g_{k i}+b\left(\overline{\boldsymbol{\eta}}_{k} \overline{\boldsymbol{\eta}}_{i}-\boldsymbol{\eta}_{k} \boldsymbol{\eta}_{i}\right) . \tag{3.5}
\end{equation*}
$$

Now transvecting (3.4) with (1/2) $\phi^{k j}$, we get by (1.11)

$$
\begin{equation*}
\left(\rho-1+b+\boldsymbol{\tau}_{r} \boldsymbol{\tau}^{r}\right) \phi_{i}^{j} \bar{\eta}_{j}=\phi^{k j} A_{k i} \bar{\eta}_{j}+\phi_{i}^{j} A_{j}^{r} \bar{\eta}_{r} . \tag{3.6}
\end{equation*}
$$

Next, contracting (3.5) with $\phi^{k j} \bar{\eta}_{j}$ and $\phi_{i}^{k} g^{i r} \bar{\eta}_{r}$ respectivily, we have

$$
\begin{align*}
& (n-2) \phi^{k j} A_{k i} \bar{\eta}_{j}=\alpha \phi_{i}^{j} \bar{\eta}_{j},  \tag{3.7}\\
& (n-2) \phi_{i}^{k} A_{k}^{r} \bar{\eta}_{r}=(\alpha+b \rho) \phi_{i}^{k} \bar{\eta}_{k}, \tag{3.8}
\end{align*}
$$

by virtue of (1.1) and (1.2) where we have put

$$
\alpha=a(\rho-1)+(n-1) \boldsymbol{\tau}_{r} \boldsymbol{\tau}^{r}-A_{r}^{r} .
$$

Substituting (3.7) and (3.8) into (3.6), we obtain

$$
\begin{equation*}
\left\{(n-2)\left(\rho-1+b+\tau_{r} \tau^{r}\right)-b \rho-2 \alpha\right\} \phi_{i}^{j} \bar{\eta}_{j}=0 . \tag{3.9}
\end{equation*}
$$

On the other hand, transvecting (3.5) with $g^{j i}$,

$$
\begin{equation*}
2 A_{r}^{r}=n \tau_{r} \tau^{r}+(n-b)(\rho-1) \tag{3.10}
\end{equation*}
$$

holds good. Then using (3.10) we have

$$
(n-2)\left(\rho-1+b+\tau_{r} \tau^{r}\right)-b \rho-2 \alpha=b(n-3) \neq 0
$$

Thus, from (3.9) we know that $\phi_{i}^{j} \bar{\eta}_{j}=0$, that is, $\mu$ is a contact transformation. Then Theorem 3 reduces to Proposition 1.
Q.E.D.

THEOREM 4. In a normal contact $\eta$-Einstein manifold $M(b \neq 0, m>1)$, any projective transformation $\mu$ is an isometry. Moreover if $\bar{\eta}(\xi)>0$ holds good, $\mu$ is an automorphism.

Proof. By definition of projective transformation, we get

$$
\begin{equation*}
\bar{\Gamma}_{j i}^{k}=\Gamma_{j i}^{k}+p_{j} \delta_{i}^{k}+p_{i} \delta_{j}^{k} \tag{3.11}
\end{equation*}
$$

for some covariant vector $p_{i}$. If we put $A_{j i}=p_{j} p_{i}-\nabla_{j} p_{i}$,

$$
\begin{equation*}
\bar{R}_{k j i}{ }^{h}=R_{k j i}{ }^{h}+\delta_{k}^{h} A_{j i}-\delta_{j}^{h} A_{k i} \tag{3.12}
\end{equation*}
$$

and especially

$$
\begin{equation*}
\bar{R}_{k j}=R_{k j}+(n-1) A_{k j} \tag{3.13}
\end{equation*}
$$

hold good.
LEMMA 1. In a normal contact $\eta$-Einstein manifold, we have for some scalar $\alpha$

$$
\begin{equation*}
\bar{g}_{k j}=\alpha\left(g_{k j}+A_{k j}\right) . \tag{3.14}
\end{equation*}
$$

Proof of Lemma 1. By Ricci's identity and (3.12) we get

$$
\begin{equation*}
R_{l k i}{ }^{a} \bar{g}_{a j}+R_{l k j}{ }^{a} \bar{g}_{a i}=A_{i \iota} \bar{g}_{k j}+A_{j l} \bar{g}_{k i}-A_{k i} \bar{g}_{j l}-A_{k j} \bar{g}_{i l} . \tag{3.15}
\end{equation*}
$$

Transvecting (3.15) with $\xi^{\prime \xi^{i}}$, we have

$$
\begin{align*}
\xi^{a} \xi^{b} \bar{g}_{a b}\left(g_{k j}+A_{k j}\right)=\left(1+\xi^{a} \xi^{b} A_{a b}\right) \bar{g}_{k j} & +\xi^{r}\left(\bar{g}_{k r} \eta_{j}-\bar{g}_{j r} \eta_{k}\right)  \tag{3.16}\\
& +\xi^{a} \xi^{b}\left(A_{a j} \bar{g}_{b k}-A_{a k} \bar{g}_{b j}\right) .
\end{align*}
$$

Adding to (3.16) the identity which is obtained from (3.16) by permuting $k$ and $j$, we get (3.14) unless $g_{k j}+A_{k j}=0$. Next, if $g_{k j}+A_{k j}=0$, operating $\nabla_{\iota}$ to the both sides of $\nabla_{k} p_{j}=p_{k} p_{j}+g_{k j}$, and using Ricci's identity,

$$
\begin{equation*}
R_{l k j}^{r} p_{r}=g_{k j} p_{l}-g_{l j} p_{k} \tag{3.17}
\end{equation*}
$$

holds good. Transvecting (3.17) with $(1 / 2) \phi^{l k}$, we get $\phi_{j}^{r} p_{r}=0$ by virtue of $b \neq 0$. So we can write $p_{l}=\sigma \eta_{l}$. By differentiating this identity covariantly and taking notice of the shew-symmetric property of $\phi_{k l}$, we obtain

$$
\begin{equation*}
2 \boldsymbol{\sigma} \phi_{k l}=\nabla_{l} \sigma \cdot \boldsymbol{\eta}_{k}-\nabla_{k} \sigma \cdot \boldsymbol{\eta}_{l} . \tag{3.18}
\end{equation*}
$$

Contracting (3.18) with $\xi^{k}$, we have $\nabla_{l} \sigma=\beta \eta_{l}$. Substituting this into (3.18) we get $\sigma=0$. Thus in this case $\mu$ is an affine transformation and consequently an isometry by virtue of Theorem 2.

Lemma 2. In a normal contact $\eta$-Einstein manifold, if $\alpha$ of Lemma

1 is a constant, $\mu$ is an isometry.
Proof of Lemma 2. Substituting $\bar{g}_{i j}=\alpha\left(g_{i j}+A_{i j}\right)$ into

$$
\nabla_{k} \bar{g}_{i j}=2 p_{k} \bar{g}_{i j}+p_{i} \bar{g}_{k j}+p_{j} \bar{g}_{i k},
$$

we have

$$
\nabla_{k} \nabla_{i} p_{j}=2\left(p_{k} \nabla_{i} p_{j}+p_{i} \nabla_{k} p_{j}+p_{j} \nabla_{k} p_{i}\right)-4 p_{k} p_{i} p_{j}-2 p_{k} g_{i j}-p_{i} y_{k j}-p_{j} g_{i k}
$$

Then, using Ricci's identity we know that $p_{i}=\sigma \eta_{i}$ holds and that $\mu$ is an affine transformation by the same method as Lemma 1.

On the other hand, next (3.19) comes from (3.12) and (1.7).

$$
\begin{equation*}
R_{k j i}{ }^{r} \bar{\eta}_{r}+\bar{\eta}_{k} A_{j i}-\bar{\eta}_{j} A_{k i}=\bar{\eta}_{k} \bar{g}_{j i}-\bar{\eta}_{j} \bar{g}_{k i} . \tag{3.19}
\end{equation*}
$$

Now, transvecting (3.19) with (1/2) $\phi^{k j}$, we get

$$
\bar{\eta}_{j}\left\{\phi^{k j} \bar{g}_{k i}+(b-1) \phi_{i}^{j}-\phi^{k j} A_{k i}\right\}=0
$$

by virtue of (1.11). Using (3.14) this identity can be turned into

$$
\begin{equation*}
(1-\alpha)\left(\phi_{i}^{j}+\phi^{k j} A_{k i}\right) \bar{\eta}_{j}=b \phi_{i}^{j} \bar{\eta}_{j} . \tag{3.20}
\end{equation*}
$$

On the other hand, from (3.13) and (3.14) we have

$$
\begin{equation*}
a(1-\alpha)\left(g_{k i}+A_{k i}\right)=b\left(\bar{\eta}_{k} \bar{\eta}_{i}-\eta_{k} \boldsymbol{\eta}_{i}-A_{k i}\right) . \tag{3.21}
\end{equation*}
$$

Transvecting (3.21) with $\phi^{k j}$,

$$
\begin{equation*}
a(1-\alpha)\left(\phi_{i}^{j}+\phi^{k j} A_{k i}\right) \bar{\eta}_{j}=-b \phi^{k j} A_{k i} \bar{\eta}_{j} \tag{3.22}
\end{equation*}
$$

holds good. By these identities we get

$$
\begin{equation*}
\{b-(1-\alpha)(1-a)\} \phi_{i}^{j} \bar{\eta}_{j}=0 . \tag{3.23}
\end{equation*}
$$

If $b=(1-\alpha)(1-a)$, our theorem reduces to Lemma 2 and Proposition 3. If $\phi_{i}^{j} \bar{\eta}_{j}=0$, $\mu$ is a contact transformation. We can put $\bar{\eta}_{j}=\sigma \eta_{j}$. Then by (3.13) and (3.14),

$$
\overline{\boldsymbol{g}}_{j i}=c_{1} g_{j i}+c_{2} \boldsymbol{\eta}_{j} \boldsymbol{\eta}_{i}
$$

holds good, where $c_{1}=b /\{a-(n-1) / \alpha\}$ and $c_{2}=b\left(1-\sigma^{2}\right) /\{a-(n-1) / \alpha\}$. That is,

$$
\bar{g}^{j i}=\left(1 / c_{1}\right) g^{j i}-\left(c_{2} / c_{1}\left(c_{1}+c_{2}\right)\right) \xi^{j} \xi^{i}
$$

is true. If $a-(n-1) / \alpha=0$, our theorem reduces to Lemma 2. Thus, we get $\bar{\xi}^{j}=\sigma^{\prime} \xi^{j}$ and hence $\sigma$ is a constant. Then by Proposition 2 we know that Theorem 4 is true.
Q.E.D.
