# TWIN POSITIVE SYMMETRIC SOLUTIONS FOR LIDSTONE BOUNDARY VALUE PROBLEMS 

Yanping Guo and Weigao Ge

$$
\begin{aligned}
& \text { Abstract. In this paper, we consider the Lidstone boundary value problem } \\
& \qquad \begin{array}{c}
\left(\Phi\left(\mathrm{y}^{\left(2 \mathrm{n}_{\mathrm{i}} 1\right)}\right)\right)^{0}(\mathrm{t})=\mathrm{f}\left(\mathrm{t} ; \mathrm{y}(\mathrm{t}) ; \mathrm{y}^{\infty}(\mathrm{t}) ; \cdots ; \mathrm{y}^{\left(2\left(\mathrm{n}_{\mathrm{i}} 1\right)\right)}(\mathrm{t})\right) ; 0 \leq \mathrm{t} \leq 1 \\
\mathrm{y}^{(2 \mathrm{i})}(0)=\mathrm{y}^{(2 \mathrm{i})}(1)=0 ; 0 \leq \mathrm{i} \leq \mathrm{n}-1 ;
\end{array}
\end{aligned}
$$

where $\mathrm{f}:[0 ; 1] \times \mathrm{R}^{\mathrm{n}} \rightarrow \mathrm{R}$ is continuous, $\Phi(\mathrm{v})=|\mathrm{v}|^{\mathrm{pi}^{2}}{ }^{2} \mathrm{v} ; \mathrm{p}>1$. Growth conditions are imposed on $f$ which yield the existence of at least two symmetric positive solutions by using a fixed point theorem in cones.

## 1. Introduction

In this paper, we are concerned with the existence of two positive solutions for the 2 nth order Lidstone boundary value problem with a p -Laplacian operator

$$
\left\{\begin{array}{l}
\left(\Phi\left(\mathrm{y}^{(2 \mathrm{n}-1)}\right)\right)^{0}(\mathrm{t})=\mathrm{f}\left(\mathrm{t} ; \mathrm{y}(\mathrm{t}) ; \mathrm{y}^{\infty}(\mathrm{t}) ; \cdots ; \mathrm{y}^{(2(\mathrm{n}-1))}(\mathrm{t})\right) ; 0 \leq \mathrm{t} \leq 1  \tag{1}\\
\mathrm{y}^{(2 \mathrm{i})}(0)=\mathrm{y}^{(2 \mathrm{i})}(1)=0 ; 0 \leq \mathrm{i} \leq \mathrm{n}-1
\end{array}\right.
$$

where the nonlinear term f is allowed to change sign, and $\Phi(\mathrm{v})=|\mathrm{v}|^{\mathrm{p}-2} \mathrm{v} ; \mathrm{p}>1$. We will impose growth conditions on $f$ which ensure the existence of at least two positive solutions for (1) by using a fixed point theorem in cones.

Fixed point theorems and their applications to nonlinear problems have a long history. Recently, there seems to be increasing interest in multiple fixed point theorems and their applications to boundary value problems for ordinary differential

[^0]equations or finite difference equations. Such applications can be found in the papers $[1-3,6,9-10,12,14-16]$, and the recent book by Agarwal et. al. [1] which gives a good overview of the current work. Davis et. al. [7-8] imposed conditions on $f$ which yield at least three symmetric positive solutions to the 2 mth order Lidstone boundary value problem
\[

$$
\begin{cases}\mathrm{y}^{(2 \mathrm{~m})}=\mathrm{f}\left(\mathrm{y}(\mathrm{t}) ; \mathrm{y}^{\infty}(\mathrm{t}) ; \cdots ; \mathrm{y}^{(2(\mathrm{~m}-1))}(\mathrm{t})\right) ; & \mathrm{t} \in[0 ; 1]  \tag{2}\\ \mathrm{y}^{(2 \mathrm{i})}(0)=\mathrm{y}^{(2 \mathrm{i})}(1)=0 ; & 0 \leq \mathrm{i} \leq \mathrm{m}-1\end{cases}
$$
\]

where $(-1)^{m_{f}}: R^{m} \rightarrow[0 ; \infty)$ is continuous, using the Leggett-Williams fixed point theorem [13] and the five functionals fixed point theorem [4]. Avery et. al. [5] applied a twin fixed point theorem to obtain at least two positive solutions for the right focal boundary value problem

$$
\left\{\begin{array}{c}
\mathrm{y}^{\infty}+\mathrm{f}(\mathrm{y})=0 ; 0 \leq \mathrm{t} \leq 1  \tag{3}\\
\mathrm{y}(0)=\mathrm{y}^{\prime}(1)=0
\end{array}\right.
$$

where $f: R \rightarrow[0 ; \infty)$ is continuous.
In order to apply the concavity of solutions in the proofs, all the above results were obtained under the assumption that function $f$ or $(-1)^{m_{f}}$ is nonnegative. For the sign changing nonlinearity $f$, few results were obtained. In some sense this paper should be viewed as companion for [7-8], and the result in this paper fills a gap under the assumption that function $(-1)^{\mathrm{m} f}$ is nonnegative in [7-8].

The paper is divided into three sections. In section 2 , we prove a fixed point theorem in cones. In section 3, we impose growth conditions on $f$ which allow us to apply the fixed point theorem in obtaining two symmetric positive solutions for (1).

## 2. The Fixed Point Theorem in Cones

For a cone $K$ in a Banach space $X$ with norm $\|\cdot\|$ and a constant $r>0$, let $K_{r}=\{x \in K:\|x\|<r\}$, $\mathbb{K}_{r}=\{x \in K:\|x\|=r\}$. Suppose $\circledR^{\circledR}: K \rightarrow R^{+}$is a continuous functional, let

$$
\mathrm{K}(\mathrm{~b})=\{\mathrm{x} \in \mathrm{~K}: \mathbb{®}(\mathrm{x})<\mathrm{b}\} ; \quad \mathbb{C}(\mathrm{b})=\{\mathrm{x} \in \mathrm{~K}: \mathbb{®}(\mathrm{x})=\mathrm{b}\}
$$

and $K_{a}(b)=\{x \in K: a<\|x\| ; ®(x)<b\}$. The origin in $X$ is denoted by $\mu$
Definition 1. Given a cone $K$ in a real Banach space $X$, a functional $\circledR^{\circledR}$ : $K \rightarrow R$ is said to be concave functional on $K$ provided

$$
\mathbb{B}(\mathrm{tx}+(1-\mathrm{t}) \mathrm{y}) \geq \mathrm{t} \mathbb{\otimes}(\mathrm{x})+(1-\mathrm{t}) \mathbb{B}(\mathrm{y})
$$

for all $\mathrm{x} ; \mathrm{y} \in \mathrm{K}$ and $0 \leq \mathrm{t} \leq 1$.
Theorem 1. Let X be a real Banach space with norm $\|\cdot\|$ and $\mathrm{K} \subset \mathrm{X}$ a cone. Suppose $\mathrm{T}: \mathrm{K} \rightarrow \mathrm{K}$ is a completely continuous operator, and $\mathbb{\circledR}: \mathrm{K} \rightarrow \mathrm{R}^{+}$ a continuous concave functional satisfying $\mathbb{Q}(\mathrm{x}) \leq\|\mathrm{x}\|$ for all $\mathrm{x} \in \mathrm{K}$. If there are constants $\mathrm{c}>\mathrm{b}>\mathrm{a}>0$ such that
$\left(\mathrm{C}_{1}\right)\|\mathrm{Tx}\|<\mathrm{a}$ for $\mathrm{x} \in \mathfrak{Q}_{\mathrm{a}}$;
$\left(\mathrm{C}_{2}\right) \mathbb{®}(\mathrm{T} x)>$ bfor $\mathrm{x} \in \mathbb{K}$ (b);
( $\mathrm{C}_{3}$ ) $\mathbb{A}(\mathrm{x}) \leq$ bimplies $\|\mathrm{Tx}\|<\mathrm{c}$,
then T has at least a fixed points y in K such that

$$
\mathrm{a}<\|\mathrm{y}\|<\mathrm{c} ; \quad \mathbb{Q}(\mathrm{y})<\mathrm{b}
$$

Proof. Let the symbol $\operatorname{deg}_{\mathrm{K}}$ denote the degree on the cone K . Then condition ( $\mathrm{C}_{1}$ ) implies

$$
\operatorname{deg}_{K}\left\{I-T ; K_{a} ; \mu\right\}=1:
$$

Let $\Omega=\mathrm{K}(\mathrm{b}) \cap \mathrm{K}{ }_{2 \mathrm{c}}$, we now prove that

$$
\operatorname{deg}_{\kappa}\{I-\mathrm{T} ; \Omega ; \mu\}=0:
$$

 Let $\widetilde{\mathrm{T}}: \overline{\mathrm{K}}(\mathrm{b}) \rightarrow \mathrm{K}$ be an extension of $\mathrm{T} \mid @(\mathrm{~b}): \mathbb{@}(\mathrm{b}) \rightarrow \mathrm{K}$. Dugundji extension theorem ([17, p. 5]) ensures that $\widetilde{T}$ is completely continuous and $\widetilde{\mathrm{T}}(\bar{K}(\mathrm{~b})) \subset$ convexT(@ (b)). Since $\{x \in K: \mathbb{Q}(x) \geq b\} \cap\{x \in K:\|x\| \leq c\}$ is a convex set, we have

$$
\left.\inf _{x \in \bar{K}(b)} \circledR \tilde{T}^{( } x\right) \geq b>0 ; \text { and } \inf _{x \in \bar{K}(b)}\|\tilde{T} x\| \leq c:
$$

We claim

$$
\operatorname{deg}_{K}\{I-\widetilde{\mathrm{T}} ; \Omega ; \mu\}=0:
$$

Clearly @ $=\left(@(\mathrm{~b}) \cap \bar{K}_{2 c}\right) \cup\left(@{ }_{2 c} \cap \bar{K}(b)\right)$. For $x \in @$, $(1-\widetilde{T})(x) \neq \mu$ If it is not true, then there exists $x_{0} \in @$ such that

$$
x_{0}=\widetilde{T} x_{0}:
$$

If $x \in \mathbb{K}(b) \cap \bar{K}_{2 c}$, then

$$
\left.\mathrm{b}=\mathbb{\circledR}\left(\mathrm{x}_{0}\right)=\mathbb{\circledR}\left(\tilde{\mathrm{T}} \mathrm{x}_{0}\right)=\mathbb{\circledR} T \mathrm{x}_{0}\right)>\mathrm{b} ;
$$

a contradiction. On the other hand, if $x \in \mathbb{K}_{2 c} \cap \bar{K}$ (b); then

$$
2 c=\left\|x_{0}\right\|=\left\|\widetilde{T} x_{0}\right\| \leq c ;
$$

a contradiction. For $\mathrm{x} \in \Omega$, we have

$$
\mathbb{B}(x)<b ; \text { and } \mathbb{\circledR}\left(\tilde{T} x_{0}\right) \geq b .
$$

Thus, $(1-\widetilde{T})(x) \neq \mu$ for $x \in \Omega$. It follows that

$$
\operatorname{deg}_{\kappa}\{I-\tilde{\mathrm{T}} ; \Omega ; \mu\}=0:
$$

Take a homotopy $\mathrm{H}\left(\mathrm{x}_{\boldsymbol{\prime}},\right)=, \mathrm{T} \mathrm{x}+(1-,) \widetilde{\mathrm{T}} \mathrm{x}$. It is easy to see that

$$
H(x ;,) \neq x ; \text { for all } x \in @ 2 ;, \in[0 ; 1]:
$$

Thus,

$$
\operatorname{deg}_{K}\{I-T ; \Omega ; \mu\}=\operatorname{deg}_{K}\{I-\tilde{T} ; \Omega ; \mu\}=0:
$$

From $\mathbb{B}(\mathbf{x}) \leq\|\mathbf{x}\|$, we have $\mathrm{K}_{\mathrm{a}} \subset \mathrm{K}(\mathrm{b}) \cap \mathrm{K}_{2 \mathrm{c}}=\Omega$. Then

$$
\begin{aligned}
& \operatorname{deg}_{K}\left\{I-\mathrm{T} ; \Omega \backslash \mathrm{K}_{\mathrm{a}} ; \mu\right\} \\
& =\operatorname{deg}_{\mathrm{K}}\{\mathrm{I}-\mathrm{T} ; \Omega ; \mu\}-\operatorname{deg}_{\mathrm{K}}\left\{\mathrm{I}-\mathrm{T} ; \mathrm{K}_{\mathrm{a}} ; \mu\right\} \\
& =-1:
\end{aligned}
$$

So T has in K a fixed point y such that

$$
\mathrm{a}<\|\mathrm{y}\|<\mathrm{c} ; \quad \mathbb{R}(\mathrm{y})<\mathrm{b}:
$$

Theorem 1 is now proved.

## 3. Main Result

In this section, we will impose growth conditions on $f$ which allow us to apply Theorem 1 to obtain two symmetric positive solutions for (1). Let $\mathrm{G}(\mathrm{t} ; \mathrm{s})$ be the Green's function for

$$
\left\{\begin{array}{l}
\mathrm{u}^{\infty}=0 ;  \tag{4}\\
\mathrm{u}(0)=\mathrm{u}(1)=0:
\end{array} \quad \mathrm{t} \in[0 ; 1] ;\right.
$$

Thus,

$$
\mathrm{G}(\mathrm{t} ; \mathrm{s})=- \begin{cases}(1-\mathrm{t}) \mathrm{s} ; & 0 \leq \mathrm{s} \leq \mathrm{t} \leq 1 ; \\ (1-\mathrm{s}) \mathrm{t} ; & 0 \leq \mathrm{t} \leq \mathrm{s} \leq 1:\end{cases}
$$

Let $\mathrm{G}_{1}(\mathrm{t} ; \mathrm{s})=\mathrm{G}(\mathrm{t} ; \mathrm{s})$, then for $2 \leq \mathrm{j} \leq \mathrm{n}-1$ we recursively define

$$
\mathrm{G}_{\mathrm{j}}(\mathrm{t} ; \mathrm{s})=\int_{0}^{1} \mathrm{G}(\mathrm{t} ; \mathrm{r}) \mathrm{G}_{\mathrm{j}-1}(\mathrm{r} ; \mathrm{s}) \mathrm{dr}:
$$

It is easy to see that $\mathrm{G}_{\mathrm{j}}(\mathrm{t} ; \mathrm{s})(1 \leq \mathrm{j} \leq \mathrm{n}-1)$ is the Green's function for the boundary value problem

$$
\left\{\begin{array}{l}
\mathrm{y}^{(2 \mathrm{j})}(\mathrm{t})=0 ; 0 \leq \mathrm{t} \leq 1 ; \\
\mathrm{y}^{(2 \mathrm{i})}(0)=\mathrm{y}^{(2 \mathrm{i})}(1)=0 ; 0 \leq \mathrm{i} \leq \mathrm{j}-1:
\end{array}\right.
$$

For each $1 \leq \mathrm{j} \leq \mathrm{n}-1$, we define $\mathrm{A}_{\mathrm{j}}: \mathrm{C}[0 ; 1] \rightarrow \mathrm{C}[0 ; 1]$ by

$$
A_{j} v(s)=\int_{0}^{1} G_{j}(s ; i) v(i) d_{i}:
$$

For each $1 \leq \mathrm{j} \leq \mathrm{n}-1$, from the construction of $\mathrm{A}_{\mathrm{j}}$ we see that

$$
\begin{gathered}
\left(A_{j} v\right)^{(2 j)}(t)=v(t) ; 0 \leq t \leq 1 ; \\
\left(A_{j} v\right)^{(2 i)}(0)=\left(A_{j} v\right)^{(2 i)}(1)=0 ; 0 \leq i \leq j-1:
\end{gathered}
$$

Therefore (1) has a solution if and only if the boundary value problem
(5) $\left\{\begin{array}{l}\left(\Phi\left(\mathrm{v}^{0}\right)\right)^{0}(\mathrm{t})=\mathrm{f}\left(\mathrm{t} ; \mathrm{A}_{\mathrm{n}-1} \mathrm{v}(\mathrm{t}) ; \mathrm{A}_{\mathrm{n}-2} \mathrm{v}(\mathrm{t}) ; \cdots ; \mathrm{A}_{1} \mathrm{v}(\mathrm{t}) ; \mathrm{v}(\mathrm{t})\right) ; 0 \leq \mathrm{t} \leq 1 ; \\ \mathrm{v}(0)=\mathrm{v}(1)=0\end{array}\right.$
has a solution. If $y$ is a solution of (1), then $v=y^{(2(n-1))}$ is a solution of (5). Conversely, if $v$ is a solution of (5), then $y=A_{n-1} v$ is a solution of (1). In particular, if $(-1)^{\mathrm{n}-1} \mathrm{~V}(\mathrm{t}) \geq 0(\not \equiv 0)$ on $[0 ; 1]$, then $\mathrm{y}=\mathrm{A}_{\mathrm{n}-1} \mathrm{~V}$ is a positive solution of (1).

Lemma 1. $\mathrm{G}(\mathrm{t} ; \mathrm{s})$ has the following properties

$$
\begin{equation*}
\int_{0}^{1}|\mathrm{G}(\mathrm{t} ; \mathrm{s})| \mathrm{ds}=\frac{\mathrm{t}(1-\mathrm{t})}{2} ; 0 \leq \mathrm{t} \leq 1 \tag{6}
\end{equation*}
$$

$$
\begin{equation*}
\int_{ \pm}^{1- \pm}|\mathrm{G}(\mathrm{t} ; \mathrm{s})| \mathrm{ds}=\frac{1}{2} \mathrm{t}(1-\mathrm{t})-\frac{1}{2} \pm^{2} ; \pm \leq \mathrm{t} \leq 1- \pm \tag{7}
\end{equation*}
$$

Proof. From the expression of $\mathrm{G}(\mathrm{t} ; \mathrm{s})$, it is easy to see that (6) and (7) hold.
Let $X=C[0 ; 1], K=\left\{x \in X:(-1)^{\mathrm{n}-1} \mathbf{x}(\mathrm{t}) \geq 0 ; \mathrm{x}(\mathrm{t})=\mathrm{x}(1-\mathrm{t}) ; \mathrm{t} \in[0 ; 1]\right\}$, $K^{\prime}=\left\{x \in K:(-1)^{n-1} X\right.$ is concave on $\left.\left[\frac{7}{2} ; 1-\frac{1}{2}\right]\right\}$, where $\pm \in\left(0 ; \frac{1}{2}\right)$. Obviously, $K ; K^{0} \subset X$ are two cones with $K^{0} \subset K$.

Let $(-1)^{j}[a ; b]=[a ; b]$ if $j$ is even and $(-1)^{j}[a ; b]=[-b ;-a]$ if $j$ is odd. The following conditions are satisfied throughout the rest of this paper
$\left(H_{1}\right) f:[0 ; 1] \times \prod_{j=0}^{n-1}(-1)^{j}[0 ; \infty) \rightarrow R$ is continuous and for each $\left(u_{0} ; \cdots ; u_{n-1}\right)$
$\in \prod_{j=0}^{n-1}(-1)^{j}[0 ; \infty), f\left(t ; u_{0} ; \cdots ; u_{n-1}\right)$ is symmetric about $t=\frac{1}{2} ;$
$\left(H_{2}\right)(-1)^{n} f(t ; 0 ; 0 ; \cdots ; 0) \geq 0(\not \equiv 0)$ for $t \in[0 ; 1]$;
and there exist $a ; b ; d>0$ satisfying

$$
0<\frac{1- \pm}{2} \Phi^{-1}\left[\Phi\left(\frac{2 \mathrm{~d}}{ \pm}\right)+\frac{\mathrm{M} \pm}{2}\right]+\mathrm{d} \leq \mathrm{a}< \pm \mathrm{b}<\mathrm{b}
$$

such that

$$
\begin{aligned}
& \left(H_{3}\right)(-1)^{n^{n}}\left(\mathrm{t} ; \mathrm{u}_{0} ; \cdots ; \mathrm{u}_{\mathrm{n}-1}\right) \geq-\mathrm{M} \text { for }\left(\mathrm{t} ; \mathrm{u}_{0} ; \cdots ; \mathrm{u}_{\mathrm{n}-1}\right) \in[0 ; 1] \times \prod_{j=0}^{\mathrm{n}-1}(-1)^{\mathrm{j}}[0 ; \infty) \text {; } \\
& \left(H_{4}\right)(-1)^{\mathrm{n}} \mathrm{f}\left(\mathrm{t} ; \mathrm{u}_{0} ; \cdots ; \mathrm{u}_{\mathrm{n}-1}\right) \geq \frac{ \pm}{1- \pm} \mathrm{M} \text { for }\left(\mathrm{t} ; \mathrm{u}_{0} ; \cdots ; \mathrm{u}_{\mathrm{n}-1}\right) \in\left[\frac{ \pm}{2} ; 1-\frac{ \pm}{2}\right] \\
& \times \prod_{j=0}^{n-1}(-1)^{j}\left[\frac{1}{4^{n-1-j}} \pm^{n-1-j}\left(1- \pm^{n-1-j} d ; \frac{1}{8^{n-1-j}} b\right] ;\right. \\
& \left(H_{5}\right)(-1)^{n} f\left(t ; u_{0} ; \cdots ; u_{n-1}\right)<2 \Phi(2 a) \text { for }\left(t ; u_{0} ; \cdots ; u_{n-1}\right) \in[0 ; 1] \\
& \times \prod_{j=0}^{n-1}(-1)^{j}\left[0 ; \frac{1}{8^{n-1-j}} a\right] ; \\
& \left(H_{6}\right)(-1)^{\mathrm{n}} \mathrm{f}\left(\mathrm{t} ; \mathrm{u}_{0} ; \cdots ; \mathrm{u}_{\mathrm{n}-1}\right) \geq \frac{2}{1-2 \pm}(\mathrm{M} \pm+\Phi(\mathrm{b})) \text { for }\left(\mathrm{t} ; \mathrm{u}_{0} ; \cdots ; \mathrm{u}_{\mathrm{n}-1}\right) \\
& \in\left[ \pm 1-\ddagger \times \prod_{j=0}^{n-1}(-1)^{j}\left[\frac{1}{2^{n-1-j}} \pm^{n-j}\left(1-2 \Psi^{n-1-j} b ; \frac{1}{8^{n-1-j}} b\right] ;\right.\right. \\
& \left(\mathrm{H}_{7}\right)(-1)^{\mathrm{n}} \mathrm{f}\left(\mathrm{t} ; \mathrm{u}_{0} ; \cdots ; \mathrm{u}_{\mathrm{n}-1}\right) \leq \frac{2}{ \pm} \Phi\left(\frac{2 \mathrm{a}}{ \pm}\right) \text { for }\left(\mathrm{t} ; \mathrm{u}_{0} ; \cdots ; \mathrm{u}_{\mathrm{n}-1}\right) \in\left[0 ; \frac{ \pm}{2}\right] \\
& \times \prod_{j=0}^{n-1}(-1)^{j}\left[0 ; \frac{1}{8^{n-1-j}} \mathrm{~b}\right] .
\end{aligned}
$$

For $\mathrm{x} \in \mathrm{K}$, we define

$$
\begin{gathered}
\mathbb{B}(x)=\min _{ \pm \leq t \leq 1- \pm}|x(t)| ; \\
(T x)(t)=\left\{\begin{array}{c}
\left(-\int_{0}^{t} \Phi^{-1}\left(\int _ { s } ^ { \frac { 1 } { 2 } } f \left(i ; A_{n-1} x(i) ; A_{n-2} x(i) ; \cdots ;\right.\right.\right. \\
\left.\left.\left.A_{1} x(i) ; x(i)\right) d i\right) d s\right)^{+} ; 0 \leq t \leq \frac{1}{2} ; \\
\left(-\int_{t}^{1} \Phi^{-1}\left(\int _ { \frac { 1 } { 2 } } ^ { s } f \left(i ; A_{n-1} x(i) ; A_{n-2} x(i) ; \cdots ;\right.\right.\right. \\
\left.\left.\left.A_{1} x(i) ; x(i)\right) d i\right) d s\right)^{+} ; \frac{1}{2} \leq t \leq 1 ;
\end{array}\right.
\end{gathered}
$$

where $(B)^{+}=(-1)^{\mathrm{n}-1} \max \left\{(-1)^{\mathrm{n}-1} \mathrm{~B} ; 0\right\}$.

$$
(A x)(t)=\left\{\begin{array}{r}
-\int_{0}^{t} \Phi^{-1}\left(\int _ { \mathrm { s } } ^ { \frac { 1 } { 2 } } f \left(i ; A_{n-1} x(i) ; A_{n-2} x(i) ; \cdots ;\right.\right. \\
\left.\left.A_{1} x(i) ; x(i)\right) d i\right) d s ; 0 \leq t \leq \frac{1}{2} ; \\
-\int_{t}^{1} \Phi^{-1}\left(\int _ { \frac { 1 } { 2 } } ^ { s } f \left(i ; A_{n-1} x(i) ; A_{n-2} x(i) ; \cdots ;\right.\right. \\
\left.\left.A_{1} x(i) ; x(i)\right) d i\right) d s ; \frac{1}{2} \leq t \leq 1 ;
\end{array}\right.
$$

For $\mathrm{X} \in \mathrm{X}$, define $\mu: X \rightarrow K$ by $(\mu \mathrm{X})(\mathrm{t})=(-1)^{\mathrm{n}-1} \max \left\{(-1)^{\mathrm{n}-1} \mathrm{X}(\mathrm{t}) ; 0\right\}$, then $T=\mu \circ A$. For $x \in K^{0}$, let
where

$$
f^{*}\left(t ; u_{0} ; \cdots ; u_{n-1}\right)=\left\{\begin{array}{c}
f(t ; 0 ; 0 ; \cdots ; 0) ;\left(t ; u_{0} ; \cdots ; u_{n-1}\right) \\
\in[0 ; 1] \times \prod_{j=0}^{n-1}(-1)^{j+1}[0 ; \infty) ; \\
f\left(t ; u_{0}^{\prime} ; \cdots ; u_{n-1}^{\prime}\right) ;\left(t ; u_{0} ; \cdots ; u_{n-1}\right) \\
\in\left[\frac{ \pm}{2} ; 1-\frac{ \pm}{2}\right] \times \prod_{j=0}^{n-1}(-1)^{j}[0 ; \infty) ; \\
f\left(t ; u_{0}^{*} ; \cdots ; u_{n-1}^{*}\right) ;\left(t ; u_{0} ; \cdots ; u_{n-1}\right) \\
\in\left(\left[0 ; \frac{ \pm}{2}\right] \cup\left[1-\frac{ \pm}{2} ; 1\right]\right) \times \prod_{j=0}^{n-1}(-1)^{j}[0 ; \infty):
\end{array}\right.
$$

and $u_{j}^{\prime}=u_{j}$ for $u_{j} \in(-1)^{j}\left[\frac{1}{\left.4^{n i} i_{i}\right]} \pm^{n-1-j}\left(1-\Psi^{n-1-j} d ; \frac{1}{8^{n i} 1_{i} j} b\right], u_{j}^{\prime}=(-1)^{j} \frac{1}{4^{n} 1_{i j}}\right.$ $\pm^{n-1-j}\left(1-\Psi^{n-1-j} d\right.$ for $u_{j} \in(-1)^{j}\left[0 ; \frac{1}{4{ }^{n i} i_{i} T} \pm^{n-1-j}\left(1-\ddagger^{n-1-j} d\right), u_{j}^{\prime}=\right.$ $(-1)^{j} \frac{1}{8^{n i} 1 i_{i j}} b$ for $u_{j} \in(-1)^{j}\left(\frac{1}{8^{n i} i_{i j}} b_{i} \infty\right) ; u_{j}^{*}=u_{j}$ for $u_{j} \in(-1)^{j}\left[0 ; \frac{1}{8^{n i} 1_{i j}} b\right]$, $u_{j}^{*}=(-1)^{j} \frac{1}{8^{n i} 1_{i j}}$ bfor $u_{j} \in(-1)^{j}\left(\frac{1}{8^{n i} 1 i_{j}} b ; \infty\right)$.

Lemma 2. ([11, Lemma 3.5]) If $\mathrm{A}: \mathrm{K} \rightarrow \mathrm{X}$ is completely continuous, then $\mu \circ \mathrm{A}: \mathrm{K} \rightarrow \mathrm{K}$ is also completely continuous.
$\left(H_{1}\right)$ implies that $A$ and $T^{\prime}$ are well defined. From the continuity of $f$, it is easy to see that $\mathrm{A}: \mathrm{K} \rightarrow \mathrm{X}$ is completely continuous. So $\mathrm{T}: \mathrm{K} \rightarrow \mathrm{K}$ is completely continuous by using Lemma 2 . For $x \in K^{\prime}$, we have $|x(t)| \geq \frac{ \pm}{1-\frac{ \pm}{\frac{\pi}{2} \leq t \leq 1-\frac{7}{2}}} \max |x(t)| \geq$ $\pm \max _{\frac{1}{2} \leq t \leq 1-\frac{t}{2}}|x(t)|$ for $t \in\left[\ddagger 1-\#\right.$ by the concavity of $(-1)^{\mathrm{n}-1} \mathrm{x}$ on $\left[\frac{t}{2} ; 1-\frac{ \pm}{2}\right]$. Thus,

$$
\begin{equation*}
\mathfrak{B}(x) \leq\|x\| ; \text { and } \mathbb{ß}(x) \geq \pm \max _{\frac{ \pm}{2} \leq t \leq 1-\frac{\pi}{2}}|x(t)|: \tag{8}
\end{equation*}
$$

Lemma 3. Let $\left(\mathrm{H}_{1}\right)-\left(\mathrm{H}_{4}\right)$ hold. Then $\mathrm{T}^{\prime}: \mathrm{K}^{\prime} \rightarrow \mathrm{K}^{\prime}$ is completely continuous.
Proof. For all $\mathrm{x} \in \mathrm{K}^{\prime}$, from $\left(\mathrm{H}_{3}\right)$ and $\left(\mathrm{H}_{4}\right)$, we have

$$
\begin{aligned}
& (-1)^{n} \int_{S_{5}}^{\frac{1}{2}} f^{*}\left(i ; A_{n-1} x(i) ; A_{n-2} x(i) ; \cdots ; A_{1} x(i) ; x(i)\right) d i \\
& \quad=\int_{S^{\frac{5}{2}}}^{\frac{t}{2}}(-1)^{n} f^{*}\left(i ; A_{n-1} x(i) ; A_{n-2} x(i) ; \cdots ; A_{1} x(i) ; x(i)\right) d i \\
& \quad+\int_{\frac{士}{2}}^{\frac{1}{2}}(-1)^{n^{n}} f^{*}\left(i ; A_{n-1} x(i) ; A_{n-2} x(i) ; \cdots ; A_{1} x(i) ; x(i)\right) d i \\
& \quad \geq-\frac{+}{2} M+\frac{1- \pm}{2} \cdot \frac{ \pm}{1- \pm} M \\
& \quad=0 \text { for } 0 \leq t \leq \frac{ \pm}{2} ;
\end{aligned}
$$

$$
(-1)^{\mathrm{n}} \int_{\mathrm{s}}^{\frac{1}{2}} \mathrm{f}^{*}\left(\dot{i} ; \mathrm{A}_{\mathrm{n}-1} \mathrm{X}(\dot{i}) ; \mathrm{A}_{\mathrm{n}-2} \mathrm{X}(\dot{i}) ; \cdots ; \mathrm{A}_{1} \mathrm{X}(\dot{i}) ; \mathrm{x}(\dot{i})\right) \mathrm{d} \dot{\mathrm{~L}} \geq 0 \text { for } \frac{ \pm}{2} \leq \mathrm{t} \leq \frac{1}{2} ;
$$

thus,

$$
\begin{aligned}
(-1)^{\mathrm{n}-1}\left(\mathrm{~T}^{\prime} \mathrm{x}\right)(\mathrm{t}) & =\int_{0}^{\mathrm{t}} \Phi^{-1}\left((-1)^{\mathrm{n}} \int_{\mathrm{s}}^{\frac{1}{2}} \mathrm{f}^{*}\left(\dot{¿} ; \mathrm{A}_{\mathrm{n}-1} \mathrm{x}(\dot{i}) ; \cdots ; \mathrm{A}_{1} \mathrm{x}(\dot{i}) ; \mathrm{x}(\dot{i})\right) \mathrm{d} \dot{\varepsilon}\right) \mathrm{ds} \\
\geq 0 \text { for } 0 & \leq \mathrm{t} \leq \frac{1}{2} ; \\
(-1)^{\mathrm{n}-1}\left(\Phi\left(\left(\mathrm{~T}^{\prime} \mathbf{x}\right)^{\prime}\right)\right)^{\prime}(\mathrm{t}) & =(-1)^{\mathrm{n}-1} \mathrm{f}^{*}\left(\mathrm{t} ; \mathrm{A}_{\mathrm{n}-1} \mathrm{x}(\mathrm{t}) ; ; \cdots ; \mathrm{A}_{1} \mathrm{x}(\mathrm{t}) ; \mathrm{x}(\mathrm{t})\right) \\
& \leq 0 \text { for } \mathrm{t} \in\left[\frac{ \pm}{2} ; 1-\frac{ \pm}{2}\right]:
\end{aligned}
$$

So $T^{\prime}: K^{\prime} \rightarrow K^{\prime}$. Using the continuity of $f$ and the definition of $f^{*}$, it is easy to see that $\mathrm{T}^{\prime}: \mathrm{K} \rightarrow \mathrm{K}^{\prime}$ is completely continuous.

Theorem 2. Let $\left(\mathrm{H}_{1}\right)-\left(\mathrm{H}_{7}\right)$ hold. Then the boundary value problem (1) has at least two positive solutions $\mathrm{x}_{1}$ and $\mathrm{x}_{2}$ such that :

$$
0<\left\|x_{1}^{(2(n-1))}\right\|<a<\left\|x_{2}^{(2(n-1))}\right\| ; \min _{t \in[ \pm 1-\sharp]}\left|x_{2}^{(2(n-1))}(t)\right|< \pm a
$$

Proof. At first we show that T has a fixed point $\mathrm{y}_{1} \in \mathrm{~K}$ with $0<\left\|\mathrm{y}_{1}\right\|<\mathrm{a}$. In fact, for all $\mathrm{x} \in \mathfrak{@}_{\mathrm{a}}$, we have $\|\mathrm{x}\|=\mathrm{a}$. For $1 \leq \mathrm{j} \leq \mathrm{n}-1$ and $0 \leq \mathrm{t} \leq 1$, $0 \leq(-1)^{n-1-j}\left(A_{j} x\right)(t)=(-1)^{n-1-j} \int_{0}^{1} G_{j}(t ; i) x(i) d i \leq a \int_{0}^{1}\left|G_{j}(t ; i)\right| d_{i} \leq \frac{1}{8^{j}} a:$
From $\left(\mathrm{H}_{5}\right)$ we obtain

$$
\begin{aligned}
& \|T x\|=\max _{0 \leq t \leq \frac{1}{2}} \left\lvert\,\left(-\int_{0}^{t} \Phi^{-1}\left(\int _ { s } ^ { \frac { 1 } { 2 } } f \left(i ; A_{n-1} x(i) ; A_{n-2} x(i) ; \cdots ;\right.\right.\right.\right. \\
& \left.\left.\left.\mathrm{A}_{1} \mathrm{x}(\mathrm{i}) ; \mathrm{x}(\dot{i})\right) \mathrm{d} \dot{i}\right) \mathrm{ds}\right)^{+} \mid
\end{aligned}
$$

$$
\begin{aligned}
& <\frac{1}{2} \Phi^{-1}\left(\frac{1}{2} \cdot 2 \Phi(2 \mathrm{a})\right) \\
& =\mathrm{a}:
\end{aligned}
$$

The existence of $y_{1}$ is proved by using the Schauder fixed point theorem.
Obviously, $y_{1}$ is a solution of (5) if and only if $y_{1}$ is a fixed point of $A$. Next we need to prove that $y_{1}$ is a solution of (5). Suppose the contrary, i.e., there is $\mathrm{t}_{0} \in(0 ; 1)$ such that $\mathrm{y}_{1}\left(\mathrm{t}_{0}\right) \neq\left(\mathrm{A} \mathrm{y}_{1}\right)\left(\mathrm{t}_{0}\right)$. It must be $(-1)^{\mathrm{n}-1}\left(\mathrm{Ay} \mathrm{y}_{1}\right)\left(\mathrm{t}_{0}\right)<$ $0=y_{1}\left(\mathrm{t}_{0}\right)$. Let $\left(\mathrm{t}_{1} ; \mathrm{t}_{2}\right)$ be the maximal interval such that $\mathrm{t}_{0} \in\left(\mathrm{t}_{1} ; \mathrm{t}_{2}\right)$, and $(-1)^{\mathrm{n}^{-1}}\left(\mathrm{~A} \mathrm{y}_{1}\right)(\mathrm{t})<0$ for $\forall \mathrm{t} \in\left(\mathrm{t}_{1} ; \mathrm{t}_{2}\right)$. Obviously $\left[\mathrm{t}_{1} ; \mathrm{t}_{2}\right] \neq[0 ; 1]$ by $\left(\mathrm{H}_{2}\right)$. Without loss of generality, suppose $\mathrm{t}_{2}<1$. Then $\mathrm{y}_{1}(\mathrm{t}) \equiv 0$ for $\mathrm{t} \in\left[\mathrm{t}_{1} ; \mathrm{t}_{2}\right]$ and $(-1)^{\mathrm{n}-1}\left(\mathrm{~A} \mathrm{y}_{1}\right)(\mathrm{t})<0$ for $\mathrm{t} \in\left(\mathrm{t}_{1} ; \mathrm{t}_{2}\right),\left(\mathrm{A} \mathrm{y}_{1}\right)\left(\mathrm{t}_{2}\right)=0$. Thus, $(-1)^{\mathrm{n}-1}\left(\mathrm{Ay}_{1}\right)^{\prime}\left(\mathrm{t}_{2}\right) \geq$ 0 . $\left(\mathrm{H}_{2}\right)$ implies $(-1)^{\mathrm{n}-1}\left(\Phi\left(\left(\mathrm{~A} \mathrm{y}_{1}\right)^{\prime}\right)\right)^{\prime}(\mathrm{t})=(-1)^{\mathrm{n}-1} \mathrm{f}(\mathrm{t} ; 0 ; 0 \cdots ; 0) \leq 0$ for $t \in\left[t_{1} ; t_{2}\right]$. So $(-1)^{\mathrm{n}-1}\left(A y_{1}\right)^{\prime}(t) \geq 0$ for $t \in\left[t_{1} ; t_{2}\right]$. Therefore, $t_{1}=0$ and $(-1)^{\mathrm{n}-1}\left(\mathrm{Ay}_{1}\right)(0) \leq(-1)^{\mathrm{n}-1}\left(\mathrm{~A} \mathrm{y}_{1}\right)\left(\mathrm{t}_{0}\right)<0$. On the other hand, $\left(\mathrm{A} \mathrm{y}_{1}\right)(0)=0$, a contradiction.

We now show that $\left(C_{1}\right)$ of Theorem 1 is satisfied. For $x \in @{ }_{a}^{\prime}$, we have $\|\mathrm{x}\|=\mathrm{a}$. For $1 \leq \mathrm{j} \leq \mathrm{n}-1$ and $0 \leq \mathrm{t} \leq 1$, from (6) we have
$0 \leq(-1)^{\mathrm{n}-1-\mathrm{j}}\left(\mathrm{A}_{\mathrm{j}} \mathrm{x}\right)(\mathrm{t})=(-1)^{\mathrm{n}-1-j} \int_{0}^{1} \mathrm{G}_{\mathrm{j}}(\mathrm{t} ; \dot{i}) \mathrm{x}(\dot{\mathrm{i}}) \mathrm{d} \dot{i} \leq \mathrm{a} \int_{0}^{1}\left|\mathrm{G}_{\mathrm{j}}(\mathrm{t} ; \dot{i})\right| \mathrm{d}_{\mathrm{i}} \leq \frac{1}{8^{j}} \mathrm{a}:$
From $\left(\mathrm{H}_{5}\right)$ we obtain

$$
\begin{aligned}
\left\|\mathrm{T}^{\prime} \mathbf{x}\right\|= & \max _{0 \leq \mathrm{t} \leq \frac{1}{2}} \left\lvert\,-\int_{0}^{\mathrm{t}} \Phi^{-1}\left(\int _ { \mathrm { s } } ^ { \frac { 1 } { 2 } } \mathrm { f } ^ { * } \left(\dot{i} ; \mathrm{A}_{\mathrm{n}-1} \mathrm{x}(\dot{i}) ; \mathrm{A}_{\mathrm{n}-2} \mathrm{x}(\dot{i}) ; \cdots ;\right.\right.\right. \\
& \left.\left.\mathrm{A}_{1} \times(\dot{i}) ; \mathrm{x}(\dot{i})\right) \mathrm{d} \dot{i}\right) \mathrm{ds} \\
< & \frac{1}{2} \Phi^{-1}\left(\frac{1}{2} \cdot 2 \Phi(2 \mathrm{a})\right) \\
= & \mathrm{a}:
\end{aligned}
$$

Next we show that $\left(C_{2}\right)$ of Theorem 1 is satisfied. For $x \in \mathbb{C}{ }^{\prime}( \pm)$, i.e., $\mathbb{B}(x)= \pm 2$ For $\pm \leq \mathrm{t} \leq 1- \pm, 1 \leq \mathrm{j} \leq \mathrm{n}-1$, from (6), (7) and (8) we have

$$
\begin{aligned}
& \pm \mathbf{b} \leq(-1)^{\mathrm{n}-1} \mathrm{x}(\mathrm{t}) \leq \mathrm{b}, \\
& (-1)^{\mathrm{n}-1-\mathrm{j}}\left(\mathrm{~A}_{\mathrm{j}} \mathrm{x}\right)(\mathrm{t})=(-1)^{\mathrm{n}-1-\mathrm{j}} \int_{0}^{1} \mathrm{G}_{\mathrm{j}}(\mathrm{t} ; \dot{\mathrm{L}}) \mathrm{x}(\dot{\mathrm{~L}}) \mathrm{d} \dot{\mathrm{~L}} \leq \mathrm{b} \int_{0}^{1}\left|\mathrm{G}_{\mathrm{j}}(\mathrm{t} ; \dot{i})\right| \mathrm{d}_{\mathrm{i}} \leq \frac{1}{8^{\mathrm{j}}} \mathrm{~b} ;
\end{aligned}
$$

$$
\begin{aligned}
& \geq \frac{1}{2^{j}}{ }^{\dot{j}+1}\left(1-2 \Psi^{j} \mathrm{~b} .\right.
\end{aligned}
$$

we may use conditions $\left(\mathrm{H}_{3}\right)$ and $\left(\mathrm{H}_{6}\right)$ to obtain

$$
\begin{aligned}
& \mathbb{B}\left(T^{\prime} x\right)=\min _{ \pm \leq t \leq \frac{1}{2}} \left\lvert\,-\int_{0}^{t} \Phi^{-1}\left(\int _ { s } ^ { \frac { 1 } { 2 } } f ^ { * } \left(\dot{i} ; A_{n-1} x(i) ; A_{n-2} x(i) ; \cdots ;\right.\right.\right. \\
& \left.\left.\mathrm{A}_{1} \mathrm{x}(\mathrm{i}) ; \mathrm{x}(\mathrm{i})\right) \mathrm{di}\right) \mathrm{ds} \mid \\
& =\int_{0}^{ \pm} \Phi^{-1}\left(\int _ { s } ^ { \frac { 1 } { 2 } } ( - 1 ) ^ { n _ { f } } f ^ { * } \left(i ; A_{n-1} X(i) ; A_{n-2} X(i) ; \cdots ;\right.\right. \\
& \left.\mathrm{A}_{1} \mathrm{x}(\mathrm{i}) ; \mathrm{x}(\dot{i}) \mathrm{d} \dot{i}\right) \mathrm{ds} \\
& > \pm \Phi^{-1}\left(-\mathrm{M} \pm+\left(\frac{1}{2}- \pm\right) \frac{2}{1-2 \pm}(\mathrm{M} \pm+\Phi(\mathrm{b}))\right)= \pm b ;
\end{aligned}
$$

Using the continuity of $f$ and the definition of $f^{*}$, there is $c>$ bsuch that $\left\|T^{\prime} x\right\|<c$ for $\mathbb{B}(x) \leq b$ Applying Theorem $1, \mathrm{~T}^{\prime}$ has a fixed point $\mathrm{y}_{2}$ such that $\mathrm{y}_{2} \in \mathrm{~K}_{\mathrm{a}}^{\prime}( \pm \mathbf{)}$.

Finally, we show that $A x=T^{\prime} x$ for $x \in K_{a}^{\prime}( \pm) \cap\left\{u: T^{\prime} u=u\right\}$. Let $x \in K_{a}^{\prime}( \pm) \cap\left\{u: T^{\prime} u=u\right\}$, then

$$
\|\mathbf{x}\|>\mathrm{a} \geq \frac{1- \pm}{2} \Phi^{-1}\left[\Phi\left(\frac{2 \mathrm{~d}}{ \pm}\right)+\frac{\mathrm{M} \pm}{2}\right]+\mathrm{d}:
$$

We claim $\|x\|=\max _{\frac{\frac{\pi}{2} \leq t \leq 1-\frac{5}{2}}{2}}|x(t)|$. If there is $\mathrm{t}_{0} \in\left(0 ; \frac{ \pm}{2}\right)$ such that $\left|x\left(\mathrm{t}_{0}\right)\right|=$ $\|x\|>a$, then $x^{\prime}\left(t_{0}\right)=\left(A^{\prime} x\right)^{\prime}\left(t_{0}\right)=-\Phi^{-1}\left(\int_{t_{0}^{1}}^{\frac{1}{2}} f^{*}\left(\dot{i} ; A_{n-1} x(i) ; \cdots ; A_{1} x(i) ; x(i)\right)\right.$ $\left.d_{i}\right)=0$, i.e., $\int_{t_{0}}^{\frac{1}{2}} f^{*}\left(i ; A_{n-1} x(i) ; \cdots ; A_{1} x(i) ; x(i)\right) d_{i}=0$. From $\left(H_{7}\right)$, we have

$$
\begin{aligned}
\left|x\left(t_{0}\right)\right|=\|x\|= & \left\lvert\,-\int_{0}^{t_{0}} \Phi^{-1}\left(\int _ { \mathrm { s } } ^ { \frac { 1 } { 2 } } f ^ { * } \left(i ; A_{n-1} x(i) ; A_{n-2} x(i) ; \cdots ;\right.\right.\right. \\
& \left.\left.A_{1} x(i) ; x(i)\right) d_{i}\right) d s \mid \\
= & \mid \int_{0}^{t_{0}} \Phi^{-1}\left(\int _ { s } ^ { t _ { 0 } } f ^ { * } \left(i ; A_{n-1} x(i) ; A_{n-2} x(i) ; \cdots ;\right.\right. \\
& \left.\left.A_{1} x(i) ; x(i)\right) d i\right) d s \mid
\end{aligned}
$$

$$
\begin{aligned}
& \leq \frac{ \pm}{2} \Phi^{-1}\left(\int_{0}^{\frac{ \pm}{2}} \frac{2}{ \pm} \Phi\left(\frac{2 \mathrm{a}}{ \pm}\right) \mathrm{d} \dot{i}\right) \\
& =\mathrm{a}
\end{aligned}
$$

a contradiction. Therefore, $\|x\|=\max _{\frac{\pi}{2} \leq t \leq 1-\frac{-}{2}}|x(t)|$.
Next we will prove $(-1)^{\mathrm{n}-1} \times\left(\frac{ \pm}{2}\right) \geq \mathrm{d}$. Suppose this is not true, then there exists $t_{0} \in\left(\frac{1}{2} ; \frac{1}{2}\right)$ such that

$$
(-1)^{\mathrm{n}-1} \mathrm{x}^{\prime}\left(\mathrm{t}_{0}\right)>\Phi^{-1}\left[\Phi\left(\frac{2 \mathrm{~d}}{ \pm}\right)+\frac{\mathrm{M} \pm}{2}\right]:
$$

It follows from the concavity of $(-1)^{\mathrm{n}-1} \mathrm{X}$ on $\left[\frac{\ddagger}{2} ; 1-\frac{1}{2}\right]$ that

$$
(-1)^{\mathrm{n}-1} \mathrm{x}^{\prime}\left(\frac{ \pm}{2}\right) \geq(-1)^{\mathrm{n}-1} \mathrm{x}^{\prime}\left(\mathrm{t}_{0}\right)>\Phi^{-1}\left[\Phi\left(\frac{2 \mathrm{~d}}{ \pm}\right)+\frac{\mathrm{M} \pm}{2}\right]:
$$

For $0 \leq t \leq \frac{t}{2}$, we have

$$
\begin{aligned}
(-1)^{\mathrm{n}-1} \Phi\left(\mathrm{x}^{\prime}(\mathrm{t})\right)= & (-1)^{\mathrm{n}-1} \Phi\left(\mathrm{x}^{\prime}\left(\frac{ \pm}{2}\right)\right)-\int_{\mathrm{t}}^{\frac{\mathrm{t}}{2}}(-1)^{\mathrm{n}-1}\left(\Phi\left(\mathrm{x}^{\prime}(\mathrm{s})\right)\right)^{\prime} \mathrm{ds} \\
= & (-1)^{\mathrm{n}-1} \Phi\left(\mathrm{x}^{\prime}\left(\frac{ \pm}{2}\right)\right)+\int_{\mathrm{t}}^{\frac{\mathbf{t}}{2}}(-1)^{\mathrm{n}^{\prime}} \mathrm{F}^{*}\left(\mathrm{~s} ; \mathrm{A}_{\mathrm{n}-1} \mathrm{x}(\mathrm{~s}) ; \mathrm{A}_{\mathrm{n}-2 \mathrm{x}(\mathrm{~s}) ; \cdots ;}\right. \\
& \left.\mathrm{A}_{1} \mathrm{x}(\mathrm{~s}) ; \mathrm{x}(\mathrm{~s})\right) \mathrm{ds} \\
\geq & \left(\Phi\left(\frac{2 \mathrm{~d}}{ \pm}\right)+\frac{\mathrm{M} \pm}{2}\right)-\frac{\mathrm{M} \pm}{2} \\
= & \Phi\left(\frac{2 \mathrm{~d}}{ \pm}\right)
\end{aligned}
$$

i.e., $(-1)^{\mathrm{n}-1} \mathrm{X}^{\prime}(\mathrm{t}) \geq \frac{2 \mathrm{~d}}{ \pm}$. Therefore,

$$
0=(-1)^{\mathrm{n}-1} \mathrm{x}(0)=(-1)^{\mathrm{n}-1} \times\left(\frac{ \pm}{2}\right)-\int_{0}^{\frac{ \pm}{2}}(-1)^{\mathrm{n}-1} \mathrm{x}^{\prime}(\mathrm{s}) \mathrm{ds}<\mathrm{d}-\frac{ \pm}{2} \cdot \frac{2 \mathrm{~d}}{ \pm}=0
$$

a contradiction. Thus, $\mathrm{d} \leq(-1)^{\mathrm{n}-1} \mathrm{x}(\mathrm{t}) \leq \mathrm{b}$ for $\frac{\mathrm{t}}{2} \leq \mathrm{t} \leq 1-\frac{\mathrm{t}}{2}$. For $1 \leq \mathrm{j} \leq \mathrm{n}-1$ and $\frac{ \pm}{2} \leq t \leq 1-\frac{ \pm}{2}$, from (6) and (7) we have

$$
\begin{aligned}
& (-1)^{\mathrm{n}-1-\mathrm{j}}\left(\mathrm{~A}_{\mathrm{j}} \mathrm{x}\right)(\mathrm{t})=(-1)^{\mathrm{n}-1-\mathrm{j}} \int_{0}^{1} \mathrm{G}_{\mathrm{j}}(\mathrm{t} ; \dot{i}) \mathrm{x}(\dot{i}) \mathrm{d} \dot{\mathrm{~L}} \geq \mathrm{d} \int_{\frac{\frac{士}{2}}{1-\frac{\mathrm{t}}{2}}}\left|\mathrm{G}_{\mathrm{j}}(\mathrm{t} ; \dot{i})\right| \mathrm{d} \dot{ } \\
& \geq \frac{1}{4^{j}} \dot{\underline{2}}\left(1-\#^{j} \mathrm{~d}:\right.
\end{aligned}
$$

From the definition of $f^{*}$, we have $f^{*}\left(t ; A_{n-1} x(t) ; \cdots ; A_{1} x(t) ; x(t)\right)=f\left(t ; A_{n-1}\right.$ $\left.x(t) ; \cdots ; A_{1} x(t) ; x(t)\right)$ for $0 \leq t \leq 1$. Then $A x=T^{\prime} x$ for $x \in K_{a}^{\prime}( \pm) \cap$ $\left\{u: T^{\prime} u=u\right\}$. Thus, $y_{2}$ is a solution of (5). Let $x_{i}(t)=\left(A_{n-1} y_{i}\right)(t)=$ $\int_{0}^{1} G_{n-1}(t ; s) y_{i}(s) d s ; i=1 ; 2$, then $X_{1}$ and $X_{2}$ are two symmetric positive solutions of (1), and

$$
0<\left\|x_{1}^{(2(n-1))}\right\|<a<\left\|x_{2}^{(2(n-1))}\right\| ; \min _{t \in[+1- \pm]}\left|x_{2}^{(2(n-1))}(t)\right|< \pm 0
$$
