We will give the growth properties of harmonic functions of order greater than one in a half space, which generalize the result obtained by B. Levin in a half plane.

## 1. Introduction and Main Theorem

Let $\mathbf{R}$ and $\mathbf{R}_{+}$be the sets of all real numbers and of all positive real numbers, respectively. Let $\mathbf{R}^{n}(n \geq 3)$ denote the $n$ dimensional Euclidean space with points $x=\left(x^{\prime}, x_{n}\right)$, where $x^{\prime}=\left(x_{1}, x_{2}, \ldots, x_{n-1}\right) \in \mathbf{R}^{n-1}$ and $x_{n} \in \mathbf{R}$. The boundary and closure of an open set $D$ of $\mathbf{R}^{n}$ are denoted by $\partial D$ and $\bar{D}$, respectively. The upper half space is the set $H=\left\{\left(x^{\prime}, x_{n}\right) \in\right.$ $\left.\mathbf{R}^{n}: x_{n}>0\right\}$, whose boundary is $\partial H$.

For a set $E, E \subset \mathbf{R}_{+} \cup\{0\}$, we denote $\{x \in H:|x| \in E\}$ and $\{x \in \partial H:|x| \in E\}$ by $H E$ and $\partial H E$, respectively. We identify $\mathbf{R}^{n}$ with $\mathbf{R}^{n-1} \times \mathbf{R}$ and $\mathbf{R}^{n-1}$ with $\mathbf{R}^{n-1} \times\{0\}$, writing typical points $x, y \in \mathbf{R}^{n}$ as $x=\left(x^{\prime}, x_{n}\right), y=\left(y^{\prime}, y_{n}\right)$, where $y^{\prime}=\left(y_{1}, y_{2}, \ldots, y_{n-1}\right) \in \mathbf{R}^{n-1}$, and putting

$$
\begin{gather*}
x \cdot y=\sum_{j=1}^{n} x_{j} y_{j}=x^{\prime} \cdot y^{\prime}+x_{n} y_{n} \\
|x|=\sqrt{x \cdot x}, \quad\left|x^{\prime}\right|=\sqrt{x^{\prime} \cdot x^{\prime}}  \tag{1}\\
\left|x^{\prime}\right|=|x| \cos \theta, \quad x_{n}=|x| \sin \theta \quad\left(0<\theta \leq \frac{\pi}{2}\right)
\end{gather*}
$$

Let $B_{r}$ denote the open ball with center at the origin and radius $r(>0)$ in $\mathbf{R}^{n}$. We use the standard notations $u^{+}=$ $\max (u, 0)$ and $u^{-}=-\min (u, 0)$. In the sense of Lebesgue measure $d y^{\prime}=d y_{1} \cdots d y_{n-1}$ and $d y=d y^{\prime} d y_{n}$. Let $\sigma$ denote
$(n-1)$-dimensional surface area measure and let $\partial / \partial n$ denote differentiation along the inward normal into $H$.

The estimate we deal with has a long history which can be traced back to Levin's estimate of harmonic functions from below (see, e.g., [1, page 209]).

Theorem A. Let $A_{1}$ be a constant and let, $u(z)$ be harmonic in the upper half space $\mathbf{C}_{+}$and continuous on $\partial \mathbf{C}_{+}$. Suppose that

$$
\begin{gather*}
u(z) \leq A_{1} R^{\rho}, \quad z \in \mathbf{C}_{+}, R=|z|>1, \quad \rho>1, \\
|u(z)| \leq A_{1}, \quad|z| \leq 1, \operatorname{Im} z \geq 0 . \tag{2}
\end{gather*}
$$

Then

$$
\begin{equation*}
u\left(\operatorname{Re}^{i \varphi}\right) \geq-A_{2} A_{1}\left(1+R^{\rho}\right) \sin ^{-1} \varphi, \quad \operatorname{Re}^{i \varphi} \in \mathbf{C}_{+} \tag{3}
\end{equation*}
$$

where $A_{2}$ is a constant independent of $A_{1}, R, \varphi$, and the function $u(z)$.

Further versions and refinements of Theorem 1 may be found in [2, Chapter 1], $[3,4]$ and in the paper of KrasichkovTernovskiǐ [5].

In this paper, we will consider functions $u(x)$ harmonic in $H$ and continuous on $\bar{H}$. In what follows we shall denote by $M$ various values which do not depend on $K, R(=|x|), \theta$, and the function $u(x)$.

We prove in this note analogous estimates for $u(x)$ in $H$.

Theorem 1. Suppose that

$$
\begin{gather*}
u(x) \leq K R^{\rho(R)}, \quad x \in H, \quad R=|x|>1, \rho(R)>1,  \tag{4}\\
u(x) \geq-K, \quad|x| \leq 1, x_{n} \geq 0 . \tag{5}
\end{gather*}
$$

Then

$$
\begin{equation*}
u(x) \geq-M K\left(1+\rho(R) R^{\rho(R)}\right) \sin ^{1-n} \theta \tag{6}
\end{equation*}
$$

where $x \in H$ and $\rho(R)$ is nondecreasing on $[1,+\infty)$.
Remark 2. If $n=2$ and $\rho(R) \equiv \rho$, Theorem 1 is just the result of Theorem A.

Theorem 3. If (4) and (5) hold, then

$$
\begin{equation*}
u(x) \geq-M K\left(1+\rho\left(\frac{N+1}{N} R\right) R^{\rho(((N+1) / N) R)}\right) \sin ^{1-n} \theta \tag{7}
\end{equation*}
$$

where $x \in H, N(\geq 1)$ is a sufficiently large number, and $\rho(R)$ is defined in Theorem 1.

## 2. Main Lemmas

Carleman's formula [6] connects the modulus and the zeros of a function analytic in $\mathbf{C}_{+}$(see, e.g., [7, page 224]). Nevanlinna's formula (see [1, page 193]) refers to a harmonic function in a half disk. Ren obtained a generalized Nevanlinnatype formula in a half space and Poisson integral forumla for half balls, resepctively, which play important roles in our discussions.

Lemma 4 (see [8]). If $R>1$, then one has

$$
\begin{align*}
& \int_{\{x \in H:|x|=R\}} u(x) \frac{n x_{n}}{R^{n+1}} d \sigma(x) \\
& \quad+\int_{\partial H(1, R)} u\left(x^{\prime}\right)\left(\frac{1}{\left|x^{\prime}\right|^{n}}-\frac{1}{R^{n}}\right) d x^{\prime}=c_{1}+\frac{c_{2}}{R^{n}} \tag{8}
\end{align*}
$$

where

$$
\begin{gather*}
c_{1}=\int_{\{x \in H:|x|=1\}}\left((n-1) x_{n} u(x)+x_{n} \frac{\partial u(x)}{\partial n}\right) d \sigma(x), \\
c_{2}=\int_{\{x \in H:|x|=1\}}\left(x_{n} u(x)-x_{n} \frac{\partial u(x)}{\partial n}\right) d \sigma(x) . \tag{9}
\end{gather*}
$$

Lemma 5 (see [8]). Let $R>1$ and let $u(x)$ be a function in $B_{R}^{+}=B_{R} \cap H$ and continuous in $\bar{B}_{R}^{+}$. Then

$$
\begin{aligned}
& u(x)= \int_{\{y \in H:|y|=R\}} \frac{R^{2}-|x|^{2}}{\omega_{n} R} \\
& \times\left(\frac{1}{|y-x|^{n}}-\frac{1}{\left|y-x^{*}\right|^{n}}\right) u(y) d \sigma(y) \\
&+ \frac{2 x_{n}}{\omega_{n}} \int_{\partial H[0, R)}\left(\frac{1}{\left|y^{\prime}-x\right|^{n}}-\frac{R^{n}}{|x|^{n}} \frac{1}{\left|y^{\prime}-\widetilde{x}\right|^{n}}\right) \\
& \quad \times u\left(y^{\prime}\right) d y^{\prime},
\end{aligned}
$$

where $x \in B_{R}^{+}, \tilde{x}=R^{2} x /|x|^{2}, x^{*}=\left(x^{\prime},-x_{n}\right)$, and $\omega_{n}=$ $\pi^{n / 2} / \Gamma(1+(n / 2))$ is the volume of the unit n-ball in $\mathbf{R}^{n}$.

## 3. Proof of Theorem 1

By applying Lemma 4 to $u(x)$, we have

$$
\begin{align*}
& \int_{\{x \in H:|x|=R\}} u^{+}(x) \frac{n x_{n}}{R^{n+1}} d \sigma(x) \\
&+\int_{\partial H(1, R)} u^{+}\left(x^{\prime}\right)\left(\frac{1}{\left|x^{\prime}\right|^{n}}-\frac{1}{R^{n}}\right) d x^{\prime} \\
&= \int_{\{x \in H:|x|=R\}} u^{-}(x) \frac{n x_{n}}{R^{n+1}} d \sigma(x)  \tag{11}\\
&+\int_{\partial H(1, R)} u^{-}\left(x^{\prime}\right)\left(\frac{1}{\left|x^{\prime}\right|^{n}}-\frac{1}{R^{n}}\right) d x^{\prime} \\
&+c_{1}+\frac{c_{2}}{R^{n}} .
\end{align*}
$$

It immediately follows from (4) that

$$
\begin{gather*}
\int_{\{x \in H:|x|=R\}} u^{+}(x) \frac{n x_{n}}{R^{n+1}} d \sigma(x) \leq M K R^{\rho(R)-1} \\
\int_{\partial H(1, R)} \int u^{+}\left(x^{\prime}\right)\left(\frac{1}{\left|x^{\prime}\right|^{n}}-\frac{1}{R^{n}}\right) d x^{\prime} \leq M K R^{\rho(R)-1} \tag{12}
\end{gather*}
$$

Hence from (11) and (12) we have

$$
\begin{align*}
\int_{\{x \in H:|x|=R\}} u^{-}(x) \frac{n x_{n}}{R^{n+1}} d \sigma(x) & \leq M K R^{\rho(R)-1}  \tag{13}\\
\int_{\partial H(1, R)} u^{-}\left(x^{\prime}\right)\left(\frac{1}{\left|x^{\prime}\right|^{n}}-\frac{1}{R^{n}}\right) d x^{\prime} & \leq M K R^{\rho(R)-1} \tag{14}
\end{align*}
$$

And (14) gives

$$
\begin{align*}
& \int_{\partial H(1, R)} \frac{u^{-}\left(x^{\prime}\right)}{\left|x^{\prime}\right|^{n}} d x^{\prime} \\
& \quad \leq \frac{2^{n}}{2^{n}-1} \int_{\partial H(1, R)} u^{-}\left(x^{\prime}\right)\left(\frac{1}{\left|x^{\prime}\right|^{n}}-\frac{1}{(2 R)^{n}}\right) d x^{\prime}  \tag{15}\\
& \quad \leq M K \rho(R)(2 R)^{\rho(2 R)-1} .
\end{align*}
$$

Since $-u(x) \leq u^{-}(x)$, by applying Lemma 5 to $-u(x)$, we have

$$
\begin{equation*}
-u(x) \leq I_{1}(x)+I_{2}(x) \tag{16}
\end{equation*}
$$

where

$$
\begin{align*}
& I_{1}(x)=\int_{\{y \in H:|y|=R\}} \frac{R^{2}-|x|^{2}}{\omega_{n} R} \\
& \quad \times\left(\frac{1}{|y-x|^{n}}-\frac{1}{\left|y-x^{*}\right|^{n}}\right) u^{-}(y) d \sigma(y),  \tag{17}\\
& I_{2}(x)=\frac{2 x_{n}}{\omega_{n}} \int_{\partial H[0, R)}\left(\frac{1}{\left|y^{\prime}-x\right|^{n}}-\frac{R^{n}}{|x|^{n}} \frac{1}{\left|y^{\prime}-\tilde{x}\right|^{n}}\right) \\
& \quad \times u^{-}\left(y^{\prime}\right) d y^{\prime} .
\end{align*}
$$

We remark that

$$
\begin{gather*}
\frac{1}{|y-x|^{n}}-\frac{1}{\left|y-x^{*}\right|^{n}} \leq \frac{2 n x_{n} y_{n}}{|y-x|^{n+2}}  \tag{18}\\
|y-x|^{n} \geq x_{n}^{n}=|x|^{n} \sin ^{n} \theta, \quad x \in H, \quad y_{n}=0 .
\end{gather*}
$$

If we put $|x|=r>1 / 2$ and $R=2 r$ in (16), then we finally have from (13) and (18)

$$
\begin{align*}
& I_{1}(x) \leq \int_{\{y \in H:|y|=R\}} \frac{R^{2}-r^{2}}{\omega_{n} R} \frac{2 n x_{n} y_{n}}{\omega_{n}|y-x|^{n+2}} u^{-}(y) d \sigma(y) \\
& \leq M K \rho(R) R^{\rho(R)}, \\
& I_{2}(x) \leq I_{21}(x)+I_{22}(x), \tag{19}
\end{align*}
$$

where

$$
\begin{align*}
& I_{21}(x)=\frac{2}{\omega_{n} x_{n}^{n-1}} \int_{\partial H(1, R)} u^{-}\left(y^{\prime}\right) d y^{\prime}  \tag{20}\\
& I_{22}(x)=\frac{2}{\omega_{n} x_{n}^{n-1}} \int_{\partial H[0,1]} u^{-}\left(y^{\prime}\right) d y^{\prime}
\end{align*}
$$

We obtain that

$$
\begin{align*}
I_{21}(x) & \leq \frac{2 R^{n}}{\omega_{n} x_{n}^{n-1}} \int_{\partial H(1, R)} \frac{u^{-}\left(y^{\prime}\right)}{\left|y^{\prime}\right|^{n}} d y^{\prime} \\
& \leq M K \rho(R) R^{\rho(R)} \sin ^{1-n} \theta  \tag{21}\\
I_{22}(x) & \leq \frac{2 K}{\omega_{n} x_{n}^{n-1}} \int_{\partial H[0,1]} d y^{\prime} \\
& \leq M K \rho(R) \sin ^{1-n} \theta
\end{align*}
$$

from (15) and (5), respectively.
From (16), (19), and (21), we have for $|x|>1 / 2$

$$
\begin{equation*}
-u(x) \leq M K \rho(R)\left(1+\rho(R) R^{\rho(R)}\right) \sin ^{1-n} \theta \tag{22}
\end{equation*}
$$

For $|x| \leq 1 / 2$, we have from (5)

$$
\begin{equation*}
-u(x) \leq K \leq K\left(1+\rho(R) R^{\rho(R)}\right) \sin ^{1-n} \theta . \tag{23}
\end{equation*}
$$

Thus the conclusion immediately follows from (22) and (23).

## 4. Proof of Theorem 3

By modifying (15), we have

$$
\begin{align*}
& \int_{\partial H(1, R)} \frac{u^{-}\left(x^{\prime}\right)}{\left|x^{\prime}\right|^{n}} d x^{\prime} \\
& \leq \frac{(N+1)^{n}}{(N+1)^{n}-N^{n}} \int_{\partial H(1, R)} u^{-}\left(x^{\prime}\right) \\
& \times\left(\frac{1}{\left|x^{\prime}\right|^{n}}-\frac{1}{(((N+1) / N) R)^{n}}\right) d x^{\prime} \\
& \leq M K \rho\left(\frac{N+1}{N} R\right)\left(\frac{N+1}{N} R\right)^{\rho(((N+1) / N) R)-1} \tag{24}
\end{align*}
$$

Then (21), (22), and (23) are replaced accordingly by the following estimates:

$$
\begin{gather*}
I_{21}(x) \leq M K \rho\left(\frac{N+1}{N} R\right)\left(\frac{N+1}{N} R\right)^{\rho(((N+1) / N) R)-1} \sin ^{1-n} \theta, \\
-u(x) \leq M K\left(1+\rho\left(\frac{N+1}{N} R\right) R^{\rho(((N+1) / N) R)}\right) \sin ^{1-n} \theta, \\
-u(x) \leq K \leq M K\left(1+\rho\left(\frac{N+1}{N} R\right) R^{\rho \rho((N+1) / N) R)}\right) \sin ^{1-n} \theta . \tag{25}
\end{gather*}
$$

All (16), (19), (25), and (21) give

$$
\begin{equation*}
u(x) \geq-M K\left(1+\rho\left(\frac{N+1}{N} R\right) R^{\rho(((N+1) / N) R)}\right) \sin ^{1-n} \theta \tag{26}
\end{equation*}
$$

from which the conclusion immediately follows.

## Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.

## Acknowledgments

The authors wish to express their appreciation to Dr. Xuna Miao for some very useful conversations related to this problem. This work was supported by the National Natural Science Foundation of China under Grants nos. 11301140 and U1304102.
