Following a recent paper of Zand and Nezhad (2011), we establish some fixed point results in $G P$-metric spaces. The presented theorems generalize and improve several existing results in the literature. Also, some examples are presented.

## 1. Introduction

Partial metric space is a generalized metric space introduced by Matthews [1] in which each object does not necessarily have to have a zero distance from itself. A motivation is to introduce this space to give a modified version of the Banach contraction principle [2]. Subsequently, several authors studied the problem of existence and uniqueness of a fixed point for mappings satisfying different contractive conditions, see [3-23].

On the other hand, in 2006 Mustafa and Sims [24] introduced a new notion of generalized metric spaces called $G$-metric spaces. Based on the notion of a $G$-metric space, many fixed point results for different contractive conditions have been presented, for more details see [25-42].

Recently, based on the two above notions, Zand and Nezhad [43] introduced a new generalized metric space as both a generalization of a partial metric space and a G-metric space. It is given as follows.

Definition 1.1 (see [43]). Let $X$ be a nonempty set. A function $G_{p}: X \times X \times X \rightarrow[0,+\infty)$ is called a GP-metric if the following conditions are satisfied:

$$
\text { (GP1) } x=y=z \text { if } G_{p}(x, y, z)=G_{p}(z, z, z)=G_{p}(y, y, y)=G_{p}(x, x, x)
$$

(GP2) $0 \leq G_{p}(x, x, x) \leq G_{p}(x, x, y) \leq G_{p}(x, y, z)$ for all $x, y, z \in X$;
(GP3) $G_{p}(x, y, z)=G_{p}(x, z, y)=G_{p}(y, z, x)=\cdots$, symmetry in all three variables;
(GP4) $G_{p}(x, y, z) \leq G_{p}(x, a, a)+G_{p}(a, y, z)-G_{p}(a, a, a)$ for any $x, y, z, a \in X$.
Then the pair $(X, G)$ is called a GP-metric space.
Example 1.2 (see [43]). Let $X=[0, \infty)$ and define $G_{p}(x, y, z)=\max \{x, y, z\}$, for all $x, y, z \in X$. Then $\left(X, G_{p}\right)$ is a $G P$-metric space.

Proposition 1.3 (see [43]). Let $\left(X, G_{p}\right)$ be a GP-metric space, then for any $x, y, z$ and $a \in X$ it follows that
(i) $G_{p}(x, y, z) \leq G_{p}(x, x, y)+G_{p}(x, x, z)-G_{p}(x, x, x)$;
(ii) $G_{p}(x, y, y) \leq 2 G_{p}(x, x, y)-G_{p}(x, x, x)$;
(iii) $G_{p}(x, y, z) \leq G_{p}(x, a, a)+G_{p}(y, a, a)+G_{p}(z, a, a)-2 G_{p}(a, a, a)$;
(iv) $G_{p}(x, y, z) \leq G_{p}(x, a, z)+G_{p}(a, y, z)-G_{p}(a, a, a)$.

Proposition 1.4 (see [43]). Every GP-metric space $\left(X, G_{p}\right)$ defines a metric space $\left(X, D_{G_{p}}\right)$, where

$$
\begin{equation*}
D_{G_{p}}(x, y)=G_{p}(x, y, y)+G_{p}(y, x, x)-G_{p}(x, x, x)-G_{p}(y, y, y) \quad \text { for all } x, y \in X \tag{1.1}
\end{equation*}
$$

Definition 1.5 (see [43]). Let $\left(X, G_{p}\right)$ be a GP-metric space and let $\left\{x_{n}\right\}$ be a sequence of points of $X$. A point $x \in X$ is said to be the limit of the sequence $\left\{x_{n}\right\}$ or $x_{n} \rightarrow x$ if

$$
\begin{equation*}
\lim _{m, m \rightarrow \infty} G_{p}\left(x, x_{m}, x_{n}\right)=G_{p}(x, x, x) \tag{1.2}
\end{equation*}
$$

Proposition 1.6 (see [43]). Let $\left(X, G_{p}\right)$ be a GP-metric space. Then, for any sequence $\left\{x_{n}\right\}$ in $X$, and a point $x \in X$ the following are equivalent:
(A) $\left\{x_{n}\right\}$ is GP-convergent to $x$;
(B) $G_{p}\left(x_{n}, x_{n}, x\right) \rightarrow G_{p}(x, x, x)$ as $n \rightarrow \infty$;
(C) $G_{p}\left(x_{n}, x, x\right) \rightarrow G_{p}(x, x, x)$ as $n \rightarrow \infty$.

Definition 1.7 (see [43]). Let ( $X, G_{p}$ ) be a GP-metric space.
(S1) A sequence $\left\{x_{n}\right\}$ is called a GP-Cauchy if and only if $\lim _{m, n \rightarrow \infty} G_{p}\left(x_{n}, x_{m}, x_{m}\right)$ exists (and is finite).
(S2) A GP-partial metric space $\left(X, G_{p}\right)$ is said to be GP-complete if and only if every $G P$-Cauchy sequence in X is GP-convergent to $x \in X$ such that $G_{p}(x, x, x)=$ $\lim _{m, n \rightarrow \infty} G_{p}\left(x_{n}, x_{m}, x_{m}\right)$.

Now, we introduce the following.
Definition 1.8. Let $\left(X, G_{p}\right)$ be a GP-metric space.
(M1) A sequence $\left\{x_{n}\right\}$ is called a 0 -GP-Cauchy if and only if $\lim _{m, n \rightarrow \infty} G_{p}\left(x_{n}, x_{m}, x_{m}\right)=0$;
(M2) A GP-metric space ( $\mathrm{X}, \mathrm{G}_{p}$ ) is said to be 0 -GP-complete if and only if every 0 -GPCauchy sequence is GP-convergent to a point $x \in X$ such that $G_{p}(x, x, x)=0$.

Example 1.9. Let $X=[0,+\infty)$ and define $G_{p}(x, y, z)=\max \{x, y, z\}$, for all $x, y, z \in X$. Then $\left(X, G_{p}\right)$ is a GP-complete GP-metric space. Moreover, if $X=\mathbb{Q} \cap[0,+\infty)$ (where $\mathbb{Q}$ denotes the set of rational numbers), then ( $X, G_{p}$ ) is a $0-G P$-complete $G P$-metric space.

Lemma 1.10. Let $\left(X, G_{p}\right)$ be a GP-metric space. Then
(A) if $G_{p}(x, y, z)=0$, then $x=y=z$;
(B) if $x \neq y$, then $G_{p}(x, y, y)>0$.

Proof. By (GP2) we have

$$
\begin{equation*}
G_{p}(x, x, x), G_{p}(y, y, y), G_{p}(x, y, y), G_{p}(x, x, y) \leq G_{p}(x, y, z)=0 . \tag{1.3}
\end{equation*}
$$

Then, by Proposition 1.4, we have $D_{G_{p}}(x, y)=0$, that is, $x=y$. Similarly, we can obtain that $y=z$. The assertion (A) is proved.

On the other hand, if $x \neq y$ and $G_{p}(x, y, y)=0$, then by (A), $x=y$ which is a contradiction and so (B) holds.

In this paper, we establish some fixed point results in GP-metric spaces analogous to results of Ilić et al. [44] which were proved in partial metric spaces. Also, some examples are provided to illustrate our results. To our knowledge, we are the first to give some fixed point results in GP-metric spaces, and so is the novelty and original contributions of this paper. This opens the door to other possible fixed (common fixed) point results.

## 2. Main Results

We start by stating a fixed point result of Ilić et al. [44].
Theorem 2.1 (see [44]). Let ( $\mathrm{X}, \mathrm{p}$ ) be a complete partial metric space. Let $f$ be a self-mapping on X . Suppose that for all $x, y, z \in X$ the following condition holds:

$$
\begin{equation*}
p(f x, f y) \leq \max \{\alpha p(x, y), p(x, x), p(y, y)\}, \tag{2.1}
\end{equation*}
$$

where $0 \leq \alpha<1$. Then
(1) the set $X_{P}=\left\{y \in X: p(x, x)=\inf _{y \in X} p(y, y)\right\}$ is nonempty;
(2) there is a unique $u \in X_{P}$ such that $f u=u$;
(3) for all $x \in X_{P}$ the sequence $\left\{f^{n} x\right\}$ converges to $u$ with respect to the metric $d_{p}$ (where $d_{p}(x, y)=p(x, y)-p(x, x)-p(y, y)$ for $\left.x, y \in X\right)$.

The analog of Theorem 2.1 in GP-metric spaces is given as follows.

Theorem 2.2. Let $\left(X, G_{p}\right)$ be a GP-complete GP-metric space. Let $f$ be a self-mapping on $X$. Suppose that for all $x, y, z \in X$ the following condition holds:

$$
\begin{equation*}
G_{p}(f x, f y, f z) \leq \max \left\{r G_{p}(x, y, z), G_{p}(x, x, x), G_{p}(y, y, y), G_{p}(z, z, z)\right\} \tag{2.2}
\end{equation*}
$$

where $0 \leq r<1$. Then
(T1) the set $X_{G_{p}}=\left\{y \in X: G_{p}(x, x, x)=\inf _{y \in X} G_{p}(y, y, y)\right\}$ is nonempty;
(T2) there is a unique $x^{*} \in X_{G_{p}}$ such that $f x^{*}=x^{*}$;
(T3) for all $x \in X_{G_{P}}$ the sequence $\left\{f^{n} x\right\}$ converges to $x^{*}$ with respect to the metric $D_{G_{p}}$.
Proof. Let $x \in X$. By (2.2), we have

$$
\begin{equation*}
G_{p}(f x, f x, f x) \leq \max \left\{r G_{p}(x, x, x), G_{p}(x, x, x)\right\}=G_{p}(x, x, x) \tag{2.3}
\end{equation*}
$$

Hence, $\left\{G_{p}\left(f^{n} x, f^{n} x, f^{n} x\right)\right\}_{n \geq 0}$ is a nonincreasing sequence. Put

$$
\begin{gather*}
S_{x}:=\lim _{n} G_{p}\left(f^{n} x, f^{n} x, f^{n} x\right)=\inf _{n} G_{p}\left(f^{n} x, f^{n} x, f^{n} x\right),  \tag{2.4}\\
\Gamma_{x}:=\frac{1}{1-r} G_{p}(x, f x, f x)+G_{p}(x, x, x) \tag{2.5}
\end{gather*}
$$

We shall show that

$$
\begin{equation*}
G_{p}\left(f^{i} x, f^{j} x, f^{j} x\right) \leq 3 \Gamma_{x} \quad \text { for all } i, j \geq 0 \tag{2.6}
\end{equation*}
$$

Again, by (2.2), we have for all $m>n \geq 0$

$$
\begin{equation*}
G_{p}\left(f^{n} x, f^{m} x, f^{m} x\right) \leq \max \left\{r G_{p}\left(f^{n-1} x, f^{m-1} x, f^{m-1} x\right), G_{p}\left(f^{n} x, f^{n} x, f^{n} x\right)\right\} \tag{2.7}
\end{equation*}
$$

At first

$$
\begin{align*}
G_{p}\left(x, f^{j} x, f^{j} x\right) & \leq G_{p}(x, f x, f x)+G_{p}\left(f x, f^{j} x, f^{j} x\right) \\
& \leq G_{p}(x, f x, f x)+\max \left\{r G_{p}\left(x, f^{j-1} x, f^{j-1} x\right), G_{p}(x, x, x)\right\} \tag{2.8}
\end{align*}
$$

Similarly

$$
\begin{equation*}
G_{p}\left(x, f^{j-1} x, f^{j-1} x\right) \leq G_{p}(x, f x, f x)+\max \left\{r G_{p}\left(x, f^{j-2} x, f^{j-2} x\right), G_{p}(x, x, x)\right\} \tag{2.9}
\end{equation*}
$$

Then we have

$$
\begin{equation*}
G_{p}\left(x, f^{j} x, f^{j} x\right) \leq G_{p}(x, f x, f x)+\max \left\{r G_{p}(x, f x, f x)+r^{2} G_{p}\left(x, f^{j-2} x, f^{j-2} x\right), G_{p}(x, x, x)\right\} . \tag{2.10}
\end{equation*}
$$

By continuing this process, we get

$$
\begin{align*}
& G_{p}\left(x, f^{j} x, f^{j} x\right) \\
& \quad \leq G_{p}(x, f x, f x)+\max \left\{r G_{p}(x, f x, f x)+\cdots+r^{j-1} G_{p}(x, f x, f x), G_{p}(x, x, x)\right\} \\
& \quad \leq G_{p}(x, f x, f x)+\max \left\{\frac{r}{1-r} G_{p}(x, f x, f x), G_{p}(x, x, x)\right\}  \tag{2.11}\\
& \quad \leq G_{p}(x, f x, f x)+\frac{r}{1-r} G_{p}(x, f x, f x)+G_{p}(x, x, x)=\Gamma_{x} .
\end{align*}
$$

Now, by Proposition 1.3 (ii), we have $G_{P}\left(f^{i} x, x, x\right) \leq 2 G_{P}\left(x, f^{i} x, f^{i} x\right) \leq 2 \Gamma_{x}$. Hence

$$
\begin{equation*}
G_{p}\left(f^{i} x, f^{i} x, f^{j} x\right) \leq G_{p}\left(f^{i} x, x, x\right)+G_{p}\left(x, f^{j} x, f^{j} x\right) \leq 3 \Gamma_{x} \tag{2.12}
\end{equation*}
$$

that is, (2.6) holds. On the other hand, by (GP2), we have

$$
\begin{equation*}
S_{x} \leq G_{p}\left(f^{n} x, f^{n} x, f^{n} x\right) \leq G_{p}\left(f^{n} x, f^{m} x, f^{m} x\right) \tag{2.13}
\end{equation*}
$$

Given any $\epsilon>0$, by (2.4), there exists $n_{0} \in \mathbb{N}$ such that $G_{p}\left(f^{n_{0}} x, f^{n_{0}} x, f^{n_{0}} x\right)<S_{x}+\epsilon$. Since $0 \leq r<1$, so without loss of generality, we have $3 \Gamma_{x} r^{n_{0}}<S_{x}+\epsilon$. Therefore, for all $m, n \geq 2 n_{0}$

$$
\begin{align*}
& G_{p}\left(f^{n} x, f^{m} x, f^{m} x\right) \leq \max \left\{\begin{array}{l}
r G_{p}\left(f^{n-1} x, f^{m-1} x, f^{m-1} x\right), \\
G_{p}\left(f^{n-1} x, f^{n-1} x, f^{n-1} x\right), \\
G_{p}\left(f^{m-1} x, f^{m-1} x, f^{m-1} x\right)
\end{array}\right\} \\
& \leq \max \left\{\begin{array}{l}
r^{2} G_{p}\left(f^{n-2} x, f^{m-2} x, f^{m-2} x\right), \\
G_{p}\left(f^{n-2} x, f^{n-2} x, f^{n-2} x\right), \\
G_{p}\left(f^{m-2} x, f^{m-2} x, f^{m-2} x\right)
\end{array}\right\} \leq \cdots  \tag{2.14}\\
& \leq \max \left\{\begin{array}{l}
r^{n_{0}} G_{p}\left(f^{n-n_{0}} x, f^{m-n_{0}} x, f^{m-n_{0}} x\right), \\
G_{p}\left(f^{n-n_{0}} x, f^{n-n_{0}} x, f^{n-n_{0}} x\right), \\
G_{p}\left(f^{m-n_{0}} x, f^{m-n_{0}} x, f^{m-n_{0}} x\right)
\end{array}\right\}<S_{x}+\epsilon .
\end{align*}
$$

Then, $S_{x}=\lim _{m, n \rightarrow \infty} G_{p}\left(f^{n} x, f^{m} x, f^{m} x\right)$ and so $\left\{f^{n} x\right\}$ is a GP-Cauchy sequence. Since $\left(X, G_{p}\right)$ is GP-complete, then there exists $x^{*} \in X$ such that $\left\{f^{n} x\right\} G P$-converges to $x^{*}$, that is,

$$
\begin{equation*}
G_{p}\left(x^{*}, x^{*}, x^{*}\right)=\lim _{m, n \rightarrow \infty} G_{p}\left(f^{n} x, f^{m} x, f^{m} x\right) \tag{2.15}
\end{equation*}
$$

Since $\left\{f^{n} x\right\} G P$-converges to $x^{*}$, then Proposition 1.6 yields that

$$
\begin{equation*}
G_{p}\left(x^{*}, x^{*}, x^{*}\right)=\lim _{n \rightarrow \infty} G_{p}\left(x^{*}, f^{n} x, f^{n} x\right)=\lim _{n \rightarrow \infty} G_{p}\left(f^{n} x, x^{*}, x^{*}\right) \tag{2.16}
\end{equation*}
$$

We obtain that

$$
\begin{align*}
S_{x} & =G_{p}\left(x^{*}, x^{*}, x^{*}\right)=\lim _{n \rightarrow \infty} G_{p}\left(x^{*}, f^{n} x, f^{n} x\right)  \tag{2.17}\\
& =\lim _{n \rightarrow \infty} G_{p}\left(f^{n} x, x^{*}, x^{*}\right)=\lim _{m, n \rightarrow \infty} G_{p}\left(f^{n} x, f^{m} x, f^{m} x\right) \tag{2.18}
\end{align*}
$$

For all $n \in \mathbb{N}$

$$
\begin{equation*}
G_{p}\left(x^{*}, f x^{*}, f x^{*}\right) \leq G_{p}\left(x^{*}, f^{n} x, f^{n} x\right)+G_{p}\left(f^{n} x, f x^{*}, f x^{*}\right)-G_{p}\left(f^{n} x, f^{n} x, f^{n} x\right) \tag{2.19}
\end{equation*}
$$

By taking the limit as $n \rightarrow \infty$ in the above inequality, we get

$$
\begin{equation*}
G_{p}\left(x^{*}, f x^{*}, f x^{*}\right) \leq \lim _{n \rightarrow \infty} G_{p}\left(f^{n} x, f x^{*}, f x^{*}\right) \tag{2.20}
\end{equation*}
$$

On the other hand, from (2.2), we have

$$
\lim _{n \rightarrow \infty} G_{p}\left(f^{n} x, f x^{*}, f x^{*}\right) \leq \max \left\{\begin{array}{c}
r \lim _{n \rightarrow \infty} G_{p}\left(f^{n-1} x, x^{*}, x^{*}\right)  \tag{2.21}\\
\lim _{n \rightarrow \infty} G_{p}\left(f^{n-1} x, f^{n-1} x, f^{n-1} x\right), \\
G_{p}\left(x^{*}, x^{*}, x^{*}\right)
\end{array}\right\}=G_{p}\left(x^{*}, x^{*}, x^{*}\right)
$$

Thus, $G_{p}\left(x^{*}, f x^{*}, f x^{*}\right) \leq G_{p}\left(x^{*}, x^{*}, x^{*}\right)$. By (GP2), we deduce that

$$
\begin{equation*}
G_{p}\left(x^{*}, f x^{*}, f x^{*}\right)=G_{p}\left(x^{*}, x^{*}, x^{*}\right) . \tag{2.22}
\end{equation*}
$$

Now we show that $X_{G_{p}}$ is nonempty. Let $\Omega=\inf _{y \in X} G_{p}(y, y, y)$. For all $k \in \mathbb{N}$, pike $x_{k} \in X$ with $G_{p}\left(x_{k}, x_{k}, x_{k}\right)<\Omega+1 / k$. Define $x_{n}^{*}=f^{n} x^{*}$ for all $n \geq 1$. Let us show that

$$
\begin{equation*}
\lim _{m, n \rightarrow \infty} G_{p}\left(x_{n}^{*}, x_{m}^{*}, x_{m}^{*}\right)=\Omega \tag{2.23}
\end{equation*}
$$

Given $\epsilon>0$, put $n_{0}:=[3 / \epsilon(1-r)]+1$. If $k \geq n_{0}$, then we have

$$
\begin{align*}
\Omega \leq G_{p}\left(f x_{k}^{*}, f x_{k}^{*}, f x_{k}^{*}\right) \leq G_{p}\left(x_{k}^{*}, x_{k}^{*}, x_{k}^{*}\right) & =S_{x_{k}} \leq G_{p}\left(x_{k}, x_{k}, x_{k}\right)<\Omega+\frac{1}{k} \\
& <\Omega+\frac{1}{n_{0}}<\Omega+\frac{3}{\epsilon(1-r)}  \tag{2.24}\\
& \leq G_{p}\left(f x_{k}^{*}, f x_{k}^{*}, f x_{k}^{*}\right)+\frac{3}{\epsilon(1-r)}
\end{align*}
$$

Therefore, we have

$$
\begin{equation*}
T_{k}:=G_{p}\left(x_{k}^{*}, x_{k}^{*}, x_{k}^{*}\right)-G_{p}\left(f x_{k}^{*}, f x_{k}^{*}, f x_{k}^{*}\right)<\frac{3}{\epsilon(1-r)} \tag{2.25}
\end{equation*}
$$

On the other hand, if $k \geq n_{0}$, then $G_{p}\left(x_{k}^{*}, x_{k^{*}}^{*}, x_{k}^{*}\right)=S_{x_{k}}<\Omega+1 / n_{0}$. It follows that

$$
\begin{equation*}
G_{p}\left(x_{k}^{*}, x_{k}^{*}, x_{k}^{*}\right)<\Omega+\frac{3}{\epsilon(1-r)} \tag{2.26}
\end{equation*}
$$

By (GP4), (2.22), and (2.25), we can obtain

$$
\begin{align*}
G_{p}\left(x_{n}^{*}, x_{m}^{*}, x_{m}^{*}\right) & \leq G_{p}\left(x_{n}^{*}, f x_{n}^{*}, f x_{n}^{*}\right)+G_{p}\left(f x_{n}^{*}, x_{m}^{*}, x_{m}^{*}\right)-G_{p}\left(f x_{n}^{*}, f x_{n}^{*}, f x_{n}^{*}\right) \\
& =T_{n}+G_{p}\left(f x_{n}^{*}, x_{m}^{*}, x_{m}^{*}\right)  \tag{2.27}\\
G_{p}\left(f x_{n}^{*}, x_{m}^{*}, x_{m}^{*}\right) & \leq G_{p}\left(f x_{n}^{*}, f x_{m}^{*}, f x_{m}^{*}\right)+G_{p}\left(f x_{m}^{*}, x_{m}^{*}, x_{m}^{*}\right)-G_{p}\left(f x_{m}^{*}, f x_{m}^{*}, f x_{m}^{*}\right) \\
& =G_{p}\left(f x_{n}^{*}, f x_{m}^{*}, f x_{m}^{*}\right)+T_{m} .
\end{align*}
$$

Thus

$$
\begin{align*}
G_{p}\left(x_{n}^{*}, x_{m}^{*}, x_{m}^{*}\right) & \leq T_{m}+T_{n}+G_{p}\left(f x_{n}^{*}, f x_{m}^{*}, f x_{m}^{*}\right)  \tag{2.28}\\
& \leq T_{m}+T_{n}+\max \left\{r G_{p}\left(x_{n}^{*}, x_{m}^{*}, x_{m}^{*}\right), G_{p}\left(x_{n}^{*}, x_{n}^{*}, x_{n}^{*}\right), G_{p}\left(x_{m}^{*}, x_{m}^{*}, x_{m}^{*}\right)\right\} .
\end{align*}
$$

Now, by (2.25) and (2.26), we have

$$
\begin{align*}
\Omega \leq G_{p}\left(x_{n}^{*}, x_{m}^{*}, x_{m}^{*}\right) & \leq \max \left\{\frac{2}{3} \epsilon, \frac{2}{3} \epsilon(1-r)+G_{p}\left(x_{n}^{*}, x_{n}^{*}, x_{n}^{*}\right), \frac{2}{3} \epsilon(1-r)+G_{p}\left(x_{m}^{*}, x_{m}^{*}, x_{m}^{*}\right)\right\} \\
& \leq \max \left\{\frac{2}{3} \epsilon, \Omega+\epsilon(1-r)\right\}<\Omega+\epsilon \tag{2.29}
\end{align*}
$$

that is, (2.23) holds. Again, Since $\left(X, G_{p}\right)$ is GP-complete, then there exists $y \in X$ such that

$$
\begin{equation*}
G_{p}(y, y, y)=\lim _{n \rightarrow \infty} G_{p}\left(y, x_{n}^{*}, x_{n}^{*}\right)=\lim _{n \rightarrow \infty} G_{p}\left(x_{n}^{*}, y, y\right)=\lim _{m, n \rightarrow \infty} G_{p}\left(x_{n}^{*}, x_{m}^{*}, x_{m}^{*}\right)=\Omega \tag{2.30}
\end{equation*}
$$

This leads that $y \in X_{G_{p}}$, so $X_{G_{p}}$ is nonempty.
Let $x \in X$. By (2.22), we get

$$
\begin{equation*}
\Omega \leq G_{p}\left(f x^{*}, f x^{*}, f x^{*}\right) \leq G_{p}\left(x^{*}, f x^{*}, f x^{*}\right)=G_{p}\left(x^{*}, x^{*}, x^{*}\right)=S_{x}=\Omega \tag{2.31}
\end{equation*}
$$

From (GP1), it follows that $x^{*}=f x^{*}$. By (2.17), we have

$$
\begin{align*}
\lim _{n \rightarrow \infty} D_{G_{p}}\left(f^{n} x, x^{*}\right)= & \lim _{n \rightarrow \infty} G_{p}\left(f^{n} x, x^{*}, x^{*}\right)+\lim _{n \rightarrow \infty} G_{p}\left(x^{*}, f^{n} x, f^{n} x\right) \\
& -\lim _{n \rightarrow \infty} G_{p}\left(f^{n} x, f^{n} x, f^{n} x\right)-G_{p}\left(x^{*}, x^{*}, x^{*}\right)  \tag{2.32}\\
= & 0 .
\end{align*}
$$

Therefore, for all $x \in X_{P}$ the sequence $\left\{f^{n} x\right\}$ converges with respect to the metric $D_{G_{p}}$ to $x^{*}$. The uniqueness of the fixed point follows easily from (2.2).

We illustrate Theorem 2.2 by the following examples.
Example 2.3. Let $X=[0, \infty)$ and define $G_{p}(x, y, z)=\max \{x, y, z\}$, for all $x, y, z \in X$. Then $\left(X, G_{p}\right)$ is a complete GP-metric space. Clearly, $(X, G)$ is not a $G$-metric space. Consider $f$ : $X \rightarrow X$ defined by $f x=x^{2} /(1+x)$. Without loss of generality, take $x \leq y \leq z$. We have

$$
\begin{align*}
G_{p}(f x, f y, f z) & =\frac{z^{2}}{1+z} \\
& \leq z=\max \left\{G_{p}(x, x, x), G_{p}(y, y, y), G_{p}(z, z, z)\right\}  \tag{2.33}\\
& =\max \left\{r G_{p}(x, y, z), G_{p}(x, x, x), G_{p}(y, y, y), G_{p}(z, z, z)\right\}
\end{align*}
$$

for all $r \in[0,1)$. So, (2.2) holds. Here, $u=0$ is the unique fixed point of $f$.
Example 2.4. Let $X=[0, \infty)$. Define $G_{p}: X^{3} \rightarrow[0, \infty)$ by $G_{p}(x, y, z)=\max \{x, y, z\}$. Clearly, $\left(X, G_{p}\right)$ is a GP-metric space. Define $f: X \rightarrow X$ by

$$
f x= \begin{cases}x^{2}, & 0 \leq x \leq \frac{1}{3}  \tag{2.34}\\ \frac{(1-x)}{2}, & \frac{1}{3}<x \leq \frac{1}{2} \\ \frac{1}{(2 x+1)} & x>\frac{1}{2}\end{cases}
$$

Then, the inequality (2.2) of Theorem 2.2 holds. Here, $u=0$ is the unique fixed point of $f$.

Proof. Clearly, $M(x, y, z):=\max \left\{r G_{p}(x, y, z), G_{p}(x, x, x), G_{p}(y, y, y), G_{p}(z, z, z)\right\}=\max \{x, y$, $z\}$, for all $r \in(0,1)$. We have the following cases.
Case $1(0 \leq x, y, z \leq 1 / 3)$.
Consider the following:

$$
\begin{equation*}
G_{p}(f x, f y, f z)=\max \left\{x^{2}, y^{2}, z^{2}\right\} \leq \max \{x, y, z\}=M(x, y, z) \tag{2.35}
\end{equation*}
$$

Case $2(1 / 3<x, y, z \leq 1 / 2)$.
Consider the following:

$$
\begin{equation*}
G_{p}(f x, f y, f z)=\max \left\{\frac{(1-x)}{2}, \frac{(1-y)}{2}, \frac{(1-z)}{2}\right\} \leq \max \{x, y, z\}=M(x, y, z) \tag{2.36}
\end{equation*}
$$

Case $3(x, y, z>1 / 2)$.
Consider the following:

$$
\begin{equation*}
G_{p}(f x, f y, f z)=\max \left\{\frac{1}{(2 x+1)}, \frac{1}{(2 y+1)}, \frac{1}{(2 z+1)}\right\} \leq M(x, y, z) \tag{2.37}
\end{equation*}
$$

Case $4(0 \leq x \leq 1 / 3,1 / 3<y \leq 1 / 2$ and $z>1 / 2)$.
Consider the following:

$$
\begin{equation*}
G_{p}(f x, f y, f z)=\max \left\{x^{2}, \frac{(1-y)}{2}, \frac{1}{(2 z+1)}\right\} \leq M(x, y, z) \tag{2.38}
\end{equation*}
$$

Case $5(0 \leq x, y \leq 1 / 3,1 / 3<z \leq 1 / 2)$.
Consider the following:

$$
\begin{equation*}
G_{p}(f x, f y, f z)=\max \left\{x^{2}, y^{2}, \frac{(1-x)}{2}\right\} \leq M(x, y, z) \tag{2.39}
\end{equation*}
$$

Case $6(0 \leq x, y \leq 1 / 3, z>1 / 2)$.
Consider the following:

$$
\begin{equation*}
G_{p}(f x, f y, f z)=\max \left\{x^{2}, y^{2}, \frac{1}{(2 x+1)}\right\} \leq M(x, y, z) \tag{2.40}
\end{equation*}
$$

Case $7(1 / 3<x, y \leq 1 / 2,0 \leq z \leq 1 / 3)$.
Consider the following:

$$
\begin{equation*}
G_{p}(f x, f y, f z)=\max \left\{\frac{(1-x)}{2}, \frac{(1-y)}{2}, z^{2}\right\} \leq M(x, y, z) \tag{2.41}
\end{equation*}
$$

Case $8(1 / 3 \leq x, y \leq 1 / 2, z>1 / 2)$.
Consider the following:

$$
\begin{equation*}
G_{p}(f x, f y, f z)=\max \left\{\frac{(1-x)}{2}, \frac{(1-y)}{2}, \frac{1}{(2 z+1)}\right\} \leq M(x, y, z) \tag{2.42}
\end{equation*}
$$

Case $9(x, y>1 / 2,0 \leq z \leq 1 / 3)$.
Consider the following:

$$
\begin{equation*}
G_{p}(f x, f y, f z)=\max \left\{\frac{1}{(2 x+1)}, \frac{1}{(2 y+1)}, z^{2}\right\} \leq M(x, y, z) \tag{2.43}
\end{equation*}
$$

Case $10(x, y>1 / 2,1 / 3<z \leq 1 / 2)$.
Consider the following:

$$
\begin{equation*}
G_{p}(f x, f y, f z)=\max \left\{\frac{1}{(2 x+1)}, \frac{1}{(2 y+1)}, \frac{(1-z)}{2}\right\} \leq M(x, y, z) \tag{2.44}
\end{equation*}
$$

Thus, the inequality (2.2) holds. Applying Theorem 2.2, we get $u=0$ is the unique point fixed point of $f$.

Also, Ilić et al. [44] proved the following result.
Theorem 2.5 (see [44]). Let $(X, P)$ be a complete partial metric space. Let $f$ be a self-mapping on $X$. Suppose that for all $x, y, z \in X$ the following condition holds:

$$
\begin{equation*}
p(f x, f y) \leq \max \left\{\alpha p(x, y), \frac{p(x, x)+p(y, y)}{2}\right\} \tag{2.45}
\end{equation*}
$$

where $0 \leq \alpha<1$. Then
(i) the set $X_{P}=\left\{y \in X: p(x, x)=\inf _{y \in X} p(y, y)\right\}$ is nonempty;
(ii) there is a unique $x^{*} \in X_{P}$ such that $f x^{*}=x^{*}$;
(iii) for all $x \in X_{P}$, the sequence $\left\{f^{n} x\right\}$ converges to $x^{*}$ with respect to the metric $d_{p}$.

The analog of Theorem 2.5 in GP-metric spaces is stated as follows.
Theorem 2.6. Let $\left(X, G_{p}\right)$ be a GP-complete GP-metric space. Let $f$ be a self-mapping on $X$. Suppose that for all $x, y, z \in X$ the following condition holds:

$$
\begin{equation*}
G_{p}(f x, f y, f z) \leq \max \left\{r G_{p}(x, y, z), \frac{G_{p}(x, x, x)+G_{p}(y, y, y)+G_{p}(z, z, z)}{3}\right\} \tag{2.46}
\end{equation*}
$$

where $0 \leq r<1$. Then
(R1) the set $X_{P}=\left\{y \in X: G_{p}(x, x, x)=\inf _{y \in X} G_{p}(y, y, y)\right\}$ is nonempty;
(R2) there is a unique $x^{*} \in X_{P}$ such that $f x^{*}=x^{*}$;
(R3) for all $x \in X_{G_{P}}$, the sequence $\left\{f^{n} x\right\}$ converges to $x^{*}$ with respect to the metric $D_{G_{p}}$.

Proof. Since

$$
\begin{align*}
& G_{p}(x, x, x), G_{p}(y, y, y), G_{p}(z, z, z)  \tag{2.47}\\
& \quad \leq \max \left\{r G_{p}(x, y, z), G_{p}(x, x, x), G_{p}(y, y, y), G_{p}(z, z, z)\right\}
\end{align*}
$$

then

$$
\begin{align*}
& \frac{G_{p}(x, x, x)+G_{p}(y, y, y)+G_{p}(z, z, z)}{3}  \tag{2.48}\\
& \quad \leq \max \left\{r G_{p}(x, y, z), G_{p}(x, x, x), G_{p}(y, y, y), G_{p}(z, z, z)\right\}
\end{align*}
$$

Thus

$$
\begin{equation*}
G_{p}(f x, f y, f z) \leq \max \left\{r G_{p}(x, y, z), G_{p}(x, x, x), G_{p}(y, y, y), G_{p}(z, z, z)\right\} \tag{2.49}
\end{equation*}
$$

Then, the conditions of Theorem 2.1 hold. Hence, it follows that (R1), (R2), and (R3) hold.
Example 2.7. Let $X=[0,1]$ and define $G_{p}(x, y, z)=\max \{x, y, z\}$, for all $x, y, z \in X$. We have $\left(X, G_{p}\right)$ is a complete GP-metric space. Take $f x=x^{2} / 2$ and $r=1 / 2$. For all $x \leq y \leq z$, we have

$$
\begin{align*}
G_{p}(f x, f y, f z) & =\frac{z^{2}}{2} \\
& \leq r G_{p}(x, y, z)  \tag{2.50}\\
& \leq \max \left\{r G_{p}(x, y, z), G_{p}(x, x, x), G_{p}(y, y, y), G_{p}(z, z, z)\right\}
\end{align*}
$$

that is, (2.2) holds. Here, $u=0$ is the unique fixed point of $f$.
Similarly, we have the following.
Theorem 2.8. Let $\left(X, G_{p}\right)$ be a GP-complete GP-metric space. Let $f$ be a self-mapping on $X$. Suppose that for all $x, y, z \in X$ the following condition holds:

$$
\begin{equation*}
G_{p}(f x, f y, f z)^{3} \leq r G_{p}(x, x, x) G_{p}(y, y, y) G_{p}(z, z, z) \tag{2.51}
\end{equation*}
$$

where $0 \leq r<1$. Then
(N1) the set $X_{G_{p}}=\left\{y \in X: G_{p}(x, x, x)=\inf _{y \in X} G_{p}(y, y, y)\right\}$ is nonempty;
(N2) there is a unique $x^{*} \in X_{G_{p}}$ such that $f x^{*}=x^{*}$;
(N3) for all $x \in X_{G_{p}}$, the sequence $\left\{f^{n} x\right\}$ converges with respect to the metric $D_{G_{p}}$ to $x^{*}$.
The following lemma is useful.

Lemma 2.9. Let $\left(X, G_{p}\right)$ be a GP-metric space and $\left\{x_{n}\right\}$ be a sequence in $X$. Assume that $\left\{x_{n}\right\} G P$ converges to a point $x \in X$ with $G_{p}(x, x, x)=0$. Then $\lim _{n \rightarrow+\infty} G_{p}\left(x_{n}, y, y\right)=G_{p}(x, y, y)$ for all $y \in X$. Moreover, $\lim _{m, n \rightarrow+\infty} G_{p}\left(x_{n}, x_{m}, x\right)=0$.

Proof. By (GP4), we have

$$
\begin{equation*}
G_{p}(x, y, y)-G_{p}\left(x, x_{n}, x_{n}\right) \leq G_{p}\left(x_{n}, y, y\right) \leq G_{p}\left(x_{n}, x, x\right)+G_{p}(x, y, y) \tag{2.52}
\end{equation*}
$$

and so $\lim _{n \rightarrow+\infty} G_{p}\left(x_{n}, y, y\right)=P(x, y, y)$. Again by (GP4), we get

$$
\begin{equation*}
G_{p}\left(x_{n}, x_{m}, x\right) \leq G_{p}\left(x_{n}, x, x\right)+G_{p}\left(x, x, x_{m}\right) \tag{2.53}
\end{equation*}
$$

and hence $\lim _{m, n \rightarrow+\infty} G_{p}\left(x_{n}, x_{m}, x\right)=0$.
Theorem 2.10. Let $\left(X, G_{p}\right)$ be a 0 -GP-complete GP-metric space and $f$ be a self-mapping on $X$. Assume that $(1 / 3) G_{p}(x, f x, f x)<G_{p}(x, y, y)$ implies

$$
\begin{equation*}
G_{p}(f x, f y, f y) \leq \alpha G_{p}(x, y, y)+\beta G_{p}(x, f x, f x)+\gamma G_{p}(y, f y, f y) \tag{2.54}
\end{equation*}
$$

for all $x, y \in X$, where $\alpha, \beta, \gamma \geq 0$ with $\alpha+\beta+\gamma<1$. Then $f$ has a unique fixed point.
Proof. If $x=f x$, then $x$ is a fixed point for $f$. Assume that $x \neq f x$. So by Lemma 1.10, it follows that $G_{p}(x, f x, f x)>0$. Therefore, $(1 / 3) G_{p}(x, f x, f x)<G_{p}(x, f x, f x)$ and so from (2.54), we have

$$
\begin{equation*}
G_{p}\left(f x, f^{2} x, f^{2} x\right) \leq r G_{p}(x, f x, f x) \quad \text { for all } x \in X, r=\frac{\alpha+\beta}{1-\gamma}<1 \tag{2.55}
\end{equation*}
$$

Let $x_{0} \in X$ and define a sequence $\left\{x_{n}\right\}$ by $x_{n}=f^{n} x_{0}$ for all $n \in \mathbb{N}$. Now by (2.55), we can obtain that

$$
\begin{equation*}
G_{p}\left(f^{n} x_{0}, f^{n+1} x_{0}, f^{n+1} x_{0}\right) \leq r G_{p}\left(f^{n-1} x_{0}, f^{n} x_{0}, f^{n} x_{0}\right) \leq \cdots \leq r^{n} G_{p}\left(x_{0}, f x_{0}, f x_{0}\right) \tag{2.56}
\end{equation*}
$$

Then, for any $m>n$, by (2.56), we get

$$
\begin{align*}
G_{p}\left(f^{n} x_{0}, f^{m} x_{0}, f^{m} x_{0}\right) \leq & G_{p}\left(f^{n} x_{0}, f^{n+1} x_{0}, f^{n+1} x_{0}\right)+G_{p}\left(f^{n+1} x_{0}, f^{m} x_{0}, f^{m} x_{0}\right) \\
\leq & G_{p}\left(f^{n} x_{0}, f^{n+1} x_{0}, f^{n+1} x_{0}\right)+G_{p}\left(f^{n+1} x_{0}, f^{n+2} x_{0}, f^{n+2} x_{0}\right) \\
& +G_{p}\left(f^{n+2} x_{0}, f^{m} x_{0}, f^{m} x_{0}\right) \\
\leq & G_{p}\left(f^{n} x_{0}, f^{n+1} x_{0}, f^{n+1} x_{0}\right)+G_{p}\left(f^{n+1} x_{0}, f^{n+2} x_{0}, f^{n+2} x_{0}\right) \\
& +G_{p}\left(f^{n+2} x_{0}, f^{n+3} x_{0}, f^{n+3} x_{0}\right)+\cdots+G_{p}\left(f^{m-1} x_{0}, f^{m} x_{0}, f^{m} x_{0}\right) \\
\leq & \frac{r^{n}}{1-r} G_{p}\left(x_{0}, f x_{0}, f x_{0}\right) . \tag{2.57}
\end{align*}
$$

It implies that $\lim _{m, n \rightarrow \infty} G_{p}\left(f^{n} x_{0}, f^{m} x_{0}, f^{m} x_{0}\right)=0$; that is, $\left\{x_{n}\right\}$ is a 0 -GP-Cauchy sequence. Since $X$ is 0 -GP-complete, so $\left\{x_{n}\right\} G P$ converges to some point $z \in X$ with $G_{p}(z, z, z)=0$, that is,

$$
\begin{equation*}
\lim _{n \rightarrow+\infty} G_{p}\left(x_{n}, z, z\right)=\lim _{n \rightarrow \infty} G_{p}\left(x_{n}, x_{n}, z\right)=G_{P}(z, z, z)=0 \tag{2.58}
\end{equation*}
$$

Now, we suppose that the following inequality holds:

$$
\begin{equation*}
\frac{1}{3} G_{p}(x, f x, f x) \geq G_{p}(x, y, y), \quad \frac{1}{3} G_{p}\left(f x, f^{2} x, f^{2} x\right) \geq G_{p}(f x, y, y) \tag{2.59}
\end{equation*}
$$

for some $x, y \in X$. Then, by Proposition 1.3 (iii) and (2.55), we have

$$
\begin{align*}
G_{p}(x, f x, f x) & \leq G_{p}(x, y, y)+2 G_{p}(f x, y, y) \\
& \leq \frac{1}{3} G_{p}(x, f x, f x)+\frac{2}{3} G_{p}\left(f x, f^{2} x, f^{2} x\right)  \tag{2.60}\\
& \leq \frac{1}{3} G_{p}(x, f x, f x)+\frac{2 r}{3} G_{p}(x, f x, f x)<G_{p}(x, f x, f x)
\end{align*}
$$

which is a contradiction. Thus, for all $x, y \in X$, either

$$
\begin{equation*}
\frac{1}{3} G_{p}(x, f x, f x)<G_{p}(x, y, y) \quad \text { or } \frac{1}{3} G_{p}\left(f x, f^{2} x, f^{2} x\right)<G_{p}(f x, y, y) \tag{2.61}
\end{equation*}
$$

holds. Therefore, either

$$
\begin{equation*}
\frac{1}{3} G_{p}\left(x_{2 n}, x_{2 n+1}, x_{2 n+1}\right) \leq G_{p}\left(x_{2 n}, z, z\right) \quad \text { or } \frac{1}{3} G_{p}\left(x_{2 n+1}, x_{2 n+2}, x_{2 n+2}\right) \leq G_{p}\left(x_{2 n+1}, z, z\right) \tag{2.62}
\end{equation*}
$$

holds for every $n \in \mathbb{N}$.

On the other hand, by (2.54), it follows that

$$
\begin{align*}
G_{p}\left(x_{2 n+1}, f z, f z\right) & \leq \alpha G_{p}\left(x_{2 n}, z, z\right)+\beta G_{p}\left(x_{2 n}, x_{2 n+1}, x_{2 n+1}\right)+\gamma G_{p}(z, f z, f z),  \tag{2.63}\\
G_{p}\left(x_{2 n+2}, f z, f z\right) & \leq \alpha G_{p}\left(x_{2 n+1}, z, z\right)+\beta G_{p}\left(x_{2 n+1}, x_{2 n+2}, x_{2 n+2}\right)+\gamma G_{p}(z, f z, f z) .
\end{align*}
$$

If we take the limit as $n \rightarrow \infty$ in each of these inequalities, having in mind (2.58), (2.62), and applying Lemma 2.9 , then we get $(1-\gamma) G_{p}(z, f z, f z) \leq 0$, that is, $z=f z$. The uniqueness of the fixed point follows easily from (2.54).

As a consequence of Theorem 2.10, we may state the following corollaries.
Corollary 2.11. Let $\left(X, G_{p}\right)$ be a 0 -GP-complete GP-metric space and $f$ be a self-mapping on $X$. Assume that

$$
\begin{equation*}
\frac{1}{3} G_{p}(x, f x, f x)<G_{p}(x, y, y) \quad \text { implies } G_{p}(f x, f y, f y) \leq r G_{p}(x, f x, f x) \tag{2.64}
\end{equation*}
$$

for all $x, y \in X$, where $0 \leq r<1$. Then $f$ has a unique fixed point.
Corollary 2.12. Let $\left(X, G_{p}\right)$ be a 0 -GP-complete GP-metric space and $f$ be a self-mapping on $X$. Assume that

$$
\begin{equation*}
\frac{1}{3} G_{p}(x, f x, f x)<G_{p}(x, y, y) \quad \text { implies } G_{p}(f x, f y, f y) \leq r G_{p}(y, f y, f y) \tag{2.65}
\end{equation*}
$$

for all $x, y \in X$, where $0 \leq r<1$. Then $f$ has a unique fixed point.

## 3. Conclusion

In [43], Zand and Nezhad initiated the notion of a GP-metric space. Also, they studied fully its topology. Based on this new space, in this paper we present some fixed point results for self mappings involving different contractive conditions. They are illustrated by some examples. The presented theorems are the first results in fixed point theory on GP-metric spaces.

## Acknowledgments

The authors thank the editor and referees for their valuable comments and suggestions.
