#### Abstract

We study the subject of a behaviour of the solutions of systems with sequential fractional $h$-differences. We give formulas for the unique solutions to initial value problems for systems in linear and semilinear cases. Moreover, the sufficient condition that guaranties the positivity of considered systems is presented.

## 1. Introduction

The first definition of the fractional derivative was introduced by Liouville and Riemann at the end of the 19th century. Later on, in the late 1960s, this idea was used by engineers for modeling various processes. Thus the fractional calculus started to be exploited since that time. This calculus is a field of mathematics that grows out of the traditional definitions of integrals, derivatives, and difference operators and deals with fractional integrals, derivatives, and differences of any order. Many authors prove that fractional differential and difference equations are more adequate for modeling physical and chemical processes than integer-order equations. Fractional differential and difference equations describe many phenomena arising in engineering, physics, economics, and science. In fact, several applications can be found in viscoelasticity, electrochemistry, electromagnetic, and so forth. For example, Machado [1] gave a novel method for the design of fractional order digital controllers. Fractional difference calculus has been investigated by many authors, for example, [2-12] and others. In particular, different delta and nabla type fractional differences have been studied in [13-15], where the authors relate these differences by deriving some dual identities. The calculus of fractional $h$-differences was given, for instance, in $[5,10,16-19]$. The properties of systems defined by the fractional difference equations where studied, for example, in [20-24]. There exist definitions of sequential operators
in continuous case with different types of derivatives like Caputo type, Riemann-Liouville type, and Hadamard type, see, for example, $[9,12,25-27]$. In parallel with this paper we developed the theory of fractional $h$-differences with sequential operators in the paper [28], where the approximation of continuous fractional sequential derivative is considered. We compute different formulas of solutions and then we try to check the system's behaviour, precisely the positivity of solutions. As far as we know the subject of positivity is well developed for fractional linear systems with continuous time; see [8, 29-32]. However, positivity of fractional discrete systems with sequential $h$-differences is still a field to be examined. In the present paper we open our studies in this field. We give formulas for the unique solutions to initial problems for systems in linear and semilinear cases. Moreover, the positivity of systems with sequential $h$-differences is considered. We consider systems with sequential $h$-differences of Caputo type, while in [32] systems with Grünwald-Letnikov operator are studied. It is worth to add that in [32] (and references within) the considered systems are not of sequential type. Additionally, we have the exact formulas of the solutions of the systems both with the sequential differences and with the ordinary differences while in [32] the recurrence form of solution for discrete systems with Grünwald-Letnikov difference is given.

The paper is organized as follows. In Section 2 all preliminary definitions, facts, and notations are gathered.

Section 3 presents systems with sequential fractional differences with results on uniqueness of solutions. We include semilinear systems in Section 4. The Section 5 concerns positivity of considered systems. Finally, the illustrative example is presented.

## 2. Preliminaries

Let us denote by $\mathscr{F}_{D}$ the set of all real valued functions defined on $D$. Let $h>0, \alpha>0$ and put $(h \mathbb{N})_{a}:=\{a, a+$ $h, a+2 h, \ldots\}$, where $a \in \mathbb{R}$. Let

$$
\begin{equation*}
\mathbb{R}_{+}^{N}=\left\{x \in \mathbb{R}^{N}: x_{i} \geq 0,1 \leq i \leq N\right\}, \quad N \in \mathbb{N}_{1} . \tag{1}
\end{equation*}
$$

Then the operator $\sigma:(h \mathbb{N})_{a} \rightarrow(h \mathbb{N})_{a}$ is defined by $\sigma(t):=$ $t+h$. The next two definitions of $h$-difference operator were originally given in [16, 17].

Definition 1. For a function $x \in \mathscr{F}_{(h \mathbb{N})_{a}}$ the forward $h$ difference operator is defined as

$$
\begin{equation*}
\left(\Delta_{h} x\right)(t):=\frac{x(\sigma(t))-x(t)}{h}, \quad t=a+n h, n \in \mathbb{N}_{0} \tag{2}
\end{equation*}
$$

while the $h$-difference sum is given by

$$
\begin{equation*}
\left({ }_{a} \Delta_{h}^{-1} x\right)(t):=h \sum_{k=0}^{n} x(a+k h) \tag{3}
\end{equation*}
$$

where $t=a+(n+1) h, n \in \mathbb{N}_{0}$ and $\left({ }_{a} \Delta_{h}^{-1} x\right)(a):=0$.
Definition 2. For arbitrary $\alpha \in \mathbb{R}$ the $h$-factorial function is defined by

$$
\begin{equation*}
t_{h}^{(\alpha)}:=h^{\alpha} \frac{\Gamma((t / h)+1)}{\Gamma((t / h)+1-\alpha)}, \tag{4}
\end{equation*}
$$

where $\Gamma$ is the Euler gamma function, that is, $\Gamma(z)=$ $\int_{0}^{+\infty} x^{z-1} e^{-x} \mathrm{~d} x$ for all $z \in \mathbb{C}$ such that $\operatorname{Re} z>0,(t / h) \notin \mathbb{Z}_{-}:=$ $\{-1,-2,-3, \ldots\}$, and we use the convention that division at a pole yields zero.

Notice that if we use the general binomial coefficient $\binom{a}{b}:=(\Gamma(a+1)) /(\Gamma(b+1) \Gamma(a-b+1))$, then (4) can be rewritten as

$$
\begin{equation*}
t_{h}^{(\alpha)}=h^{\alpha} \Gamma(\alpha+1)\binom{\frac{t}{h}}{\alpha} \tag{5}
\end{equation*}
$$

In the sequel we need the following technical properties.
Proposition 3 (see [12]). Let $\alpha \in \mathbb{R}$.
(1) For $j \in \mathbb{N}_{0}$ one has $(-1)^{j}\binom{\alpha}{j}=\binom{j-\alpha-1}{j}$, where $\alpha, j$ are such that both sides are well defined;
(2) For $n \in \mathbb{N}_{0}$ one has $\sum_{j=0}^{n}\binom{j-\alpha-1}{j}=\binom{n-\alpha}{n}$;
(3) For $k \in \mathbb{N}_{1}$ one has $\binom{\alpha-1}{k}+\binom{\alpha-1}{k-1}=\binom{\alpha}{k}$.

The next definition with another notation was stated in [17]. Here we use more suitable summations.

Definition 4. For a function $x \in \mathscr{F}_{(h \mathbb{N})_{a}}$ the fractional $h$-sum of order $\alpha>0$ is given by

$$
\begin{equation*}
\left({ }_{a} \Delta_{h}^{-\alpha} x\right)(t):=\frac{h}{\Gamma(\alpha)} \sum_{k=0}^{n}(t-\sigma(a+k h))_{h}^{(\alpha-1)} x(a+k h) \tag{6}
\end{equation*}
$$

where $t=a+(\alpha+n) h, n \in \mathbb{N}_{0}$. Moreover, we define $\left({ }_{a} \Delta_{h}^{0} x\right)(t):=x(t)$.

It is important to notice that the operator ${ }_{a} \Delta_{h}^{-\alpha}$ changes the domains of functions.

Remark 5. Note that ${ }_{a} \Delta_{h}^{-\alpha}: \mathscr{F}_{(h \mathbb{N})_{a}} \rightarrow \mathscr{F}_{(h \mathbb{N})_{a+\alpha h}}$.
According to the definition of $h$-factorial function the formula given in Definition 4 can be rewritten as

$$
\begin{align*}
\left({ }_{a} \Delta_{h}^{-\alpha} x\right)(t) & =h^{\alpha} \sum_{k=0}^{n} \frac{\Gamma(\alpha+n-k)}{\Gamma(\alpha) \Gamma(n-k+1)} x(a+k h)  \tag{7}\\
& =h^{\alpha} \sum_{k=0}^{n}\binom{n-k+\alpha-1}{n-k} x(a+k h)
\end{align*}
$$

for $t=a+(\alpha+n) h, n \in \mathbb{N}_{0}$. Observe that $\left({ }_{a} \Delta_{h}^{-\alpha} x\right)(a+\alpha h)=$ $h^{\alpha} x(a)$ and for $\alpha=1$ we have again (3).

Remark 6. In [7] one can find the following form of the fractional $h$-sum of order $\alpha>0$ :

$$
\begin{equation*}
\left({ }_{a} \Delta_{h}^{-\alpha} x\right)(t)=\frac{h^{\alpha}}{\Gamma(\alpha)} \sum_{k=a}^{t-\alpha h}\left(\frac{t-\sigma(k)}{h}\right)_{h=1}^{(\alpha-1)} x(k) \tag{8}
\end{equation*}
$$

that can be useful in implementation.
The following definition can be found in [33] for $h=1$ or in [10] for an arbitrary $h>0$.

Definition 7. Let $\alpha \in(0,1]$. The Caputo h-difference operator ${ }_{a} \Delta_{h, *}^{\alpha} x$ of order $\alpha$ for a function $x \in \mathscr{F}(h \mathbb{N})_{a}$ is defined by

$$
\begin{equation*}
\left({ }_{a} \Delta_{h, *}^{\alpha} x\right)(t):=\left({ }_{a} \Delta_{h}^{-(1-\alpha)}\left(\Delta_{h} x\right)\right)(t), \quad t \in(h \mathbb{N})_{a+(1-\alpha) h} \tag{9}
\end{equation*}
$$

Remark 8. Note that ${ }_{a} \Delta_{h, *}^{\alpha}: \mathscr{F}_{(h \mathbb{N})_{a}} \rightarrow \mathscr{F}_{(h \mathbb{N})_{a+(1-\alpha) h}}$, where $\alpha \in(0,1]$.

We need the power rule formulas in the sequel. Firstly, we easily notice that for $p \neq 0$ the well-defined $h$-factorial functions have the following property:

$$
\begin{equation*}
\Delta_{h}(t-a)_{h}^{(p)}=p(t-a)_{h}^{(p-1)} \tag{10}
\end{equation*}
$$

More properties of $h$-factorial functions can be found in [10]. In our consideration the crucial role plays the power rule formula presented in [16], that is,

$$
\begin{equation*}
\left({ }_{a} \Delta_{h}^{-\alpha} \psi\right)(t)=\frac{\Gamma(\mu+1)}{\Gamma(\mu+\alpha+1)}(t-a+\mu h)_{h}^{(\mu+\alpha)} \tag{11}
\end{equation*}
$$

where $\psi(r)=(r-a+\mu h)_{h}^{(\mu)}, r \in(h \mathbb{N})_{a}, t \in(h \mathbb{N})_{a+\alpha h}$. Note that using the general binomial coefficient one can write (11) as

$$
\begin{equation*}
\left({ }_{a} \Delta_{h}^{-\alpha} \psi\right)(t)=\Gamma(\mu+1)\binom{n+\alpha+\mu}{n} h^{\mu+\alpha} \tag{12}
\end{equation*}
$$

If $\psi \equiv 1$, then we have for $\mu=0, a=(1-\alpha) h$ and $t=n h+a+\alpha h$

$$
\begin{align*}
\left({ }_{a} \Delta_{h}^{-\alpha} 1\right)(t) & =\frac{1}{\Gamma(\alpha+1)}(t-a)_{h}^{(\alpha)} \\
& =\frac{\Gamma(n+\alpha+1)}{\Gamma(\alpha+1) \Gamma(n+1)} h^{\alpha}=\binom{n+\alpha}{n} h^{\alpha} \tag{13}
\end{align*}
$$

Let us define special functions that we use in the next section to write the formula for solutions.

Definition 9. For $\alpha, \beta>0$ we define

$$
\begin{align*}
& \varphi_{k, s}(n h):= \begin{cases}\binom{n+k \alpha+s \beta}{n} h^{k \alpha+s \beta}, & \text { for } n \in \mathbb{N}_{0} \\
0, & \text { for } n<0\end{cases} \\
& \widetilde{\varphi}_{k, s}(n h):= \begin{cases}\binom{n+\mu-1}{n} h^{\mu}=\frac{\Gamma(n+\mu)}{\Gamma(\mu) \Gamma(n+1)} h^{\mu} \\
0, & \text { for } n \in \mathbb{N}_{0}\end{cases}  \tag{14}\\
& \text { for } n<0
\end{align*}, ~ \$
$$

where $n$ belongs to the set of integers $\mathbb{Z}, k, s \in \mathbb{N}_{0}$ and $\mu=$ $k \alpha+s \beta$.

Remark 10. It is worthy to notice that for $n \in \mathbb{N}_{0}$
(a) $\varphi_{0,0}(n h)=1$;
(b) $\varphi_{1,0}(n h)=\binom{n+\alpha}{n} h^{\alpha}=\left({ }_{0} \Delta_{h}^{-\alpha} 1\right)(n h+\alpha h)$ and the values $\varphi_{1,0}((n-1) h)=\binom{n+\alpha-1}{n-1} h^{\alpha}=\left({ }_{0} \Delta_{h}^{-\alpha} 1\right)((n-1) h+\alpha h)$ are neglected for $n=0$;
(c) $\varphi_{k, s}((n-l) h)=(\Gamma(n-l+1+k \alpha+s \beta)) /(\Gamma(k \alpha+s \beta+$ 1) $\Gamma(n-l+1))$ and as the division by pole gives zero, the formula works also for $n<l, l \in \mathbb{N}_{0}$;
(d) $\varphi_{k, s}((n-l) h)=(1 /(\Gamma(k \alpha+s \beta+1)))$. $((n-l) h+k \alpha h+s \beta h)_{h}^{(k \alpha+s \beta)}, l \in \mathbb{N}_{0}$.

We also need the following proposition.
Proposition 11. Let $\alpha, \beta \in(0,1], h>0$ and $a=(\alpha-1) h, b=$ $(\beta-1) h$. Then for $n \in \mathbb{N}_{l+1}, l \in \mathbb{N}_{0}$

$$
\begin{align*}
& \left({ }_{0} \Delta_{h}^{-\alpha} \varphi_{k, s}\right)((n-l) h+a)=\varphi_{k+1, s}((n-l-1) h)  \tag{15}\\
& \left({ }_{0} \Delta_{h}^{-\beta} \varphi_{k, s}\right)((n-l) h+b)=\varphi_{k, s+1}((n-l-1) h) \tag{16}
\end{align*}
$$

Proof. We show only equality (15), as (16) is a symmetric one.

Let $\mu:=k \alpha+s \beta$. For $r \in(h \mathbb{N})_{l h}$ we define the following $h$-factorial function $\psi(r):=(r+\mu h)_{h}^{(\mu)}$. Since

$$
\begin{align*}
\varphi_{k, s}((n-l) h)= & \frac{1}{\Gamma(k \alpha+s \beta+1)} \\
& \cdot((n-l) h+k \alpha h+s \beta h)_{h}^{(k \alpha+s \beta)}  \tag{17}\\
= & \frac{1}{\Gamma(\mu+1)} \psi(n h-l h)
\end{align*}
$$

for $n \geq l$ and $\varphi_{k, s}((m-l) h)=0$ for $m<l$, by (11) we get

$$
\begin{align*}
\left({ }_{0} \Delta_{h}^{-\alpha} \varphi_{k, s}\right)(t) & =\left({ }_{l h} \Delta_{h}^{-\alpha} \varphi_{k, s}\right)(t)=\frac{1}{\Gamma(\mu+1)}\left({ }_{0} \Delta_{h}^{-\alpha} \psi\right)(t) \\
& =\frac{1}{\Gamma(\mu+1)} \frac{\Gamma(\mu+1)}{\Gamma(\mu+\alpha+1)}(t+\mu h)_{h}^{(\mu+\alpha)}  \tag{18}\\
& =\frac{1}{\Gamma(\mu+\alpha+1)}(t+\mu h)_{h}^{(\mu+\alpha)}
\end{align*}
$$

where $t=a-l h+n h$. Hence

$$
\begin{align*}
& t++\mu h=n h-(l+1) h+(k+1) \alpha h+s \beta h \\
&\left({ }_{0} \Delta_{h}^{-\alpha} \varphi_{k, s}\right)((n-l) h+a) \\
&=\frac{\Gamma(\alpha+n-(l+1)+\mu+1)}{\Gamma(\mu+\alpha+1) \Gamma(n-(l+1)+1)} h^{\mu+\alpha} \\
&=\frac{\Gamma(\alpha+n-l+\mu)}{\Gamma(\mu+\alpha+1) \Gamma(n-l)} h^{\mu+\alpha} \\
&=\binom{n-l-1+\mu+\alpha}{n-l-1} h^{\mu+\alpha} \\
&=\binom{n-(l+1)+(k+1) \alpha+s \beta}{n-(l+1)} h^{(k+1) \alpha+s \beta} \\
&=\varphi_{k+1, s}((n-l-1) h) . \tag{19}
\end{align*}
$$

From the application of the power rule follows the rule for composing two fractional $h$-sums. The proof for the case $h=1$ can be found in [7]. For any positive $h>0$ the proof is presented in [10].

Proposition 12. Let $x$ be a real valued function defined on $(h \mathbb{N})_{a}$, where $a, h \in \mathbb{R}, h>0$. For $\alpha, \beta>0$ the following equalities hold:

$$
\begin{align*}
\left({ }_{a+\beta h} \Delta_{h}^{-\alpha}\left({ }_{a} \Delta_{h}^{-\beta} x\right)\right)(t) & =\left({ }_{a} \Delta_{h}^{-(\alpha+\beta)} x\right)(t) \\
& =\left({ }_{a+\alpha h} \Delta_{h}^{-\beta}\left({ }_{a} \Delta_{h}^{-\alpha} x\right)\right)(t) \tag{20}
\end{align*}
$$

where $t \in(h \mathbb{N})_{a+(\alpha+\beta) h}$.
The next proposition gives a useful identity of transforming Caputo fractional difference equations into fractional
summations for the case when an order is from the interval $(0,1]$.

Proposition 13 (see [10]). Let $\alpha \in(0,1], h>0, a=(\alpha-$ $1) h$ and let $x$ be a real valued function defined on $(h \mathbb{N})_{a}$. The following formula holds:

$$
\begin{equation*}
\left({ }_{0} \Delta_{h}^{-\alpha}\left({ }_{a} \Delta_{h, *}^{\alpha} x\right)\right)(n h+a)=x(n h+a)-x(a), \quad n \in \mathbb{N}_{1} \tag{21}
\end{equation*}
$$

The operators presented above can be extended to vectors in a componentwise manner.

## 3. Solutions of Systems with Sequential Fractional Differences

Let $\alpha, \beta \in(0,1]$ and $x:(h \mathbb{N})_{a} \rightarrow \mathbb{R}^{N}$. Moreover, let us take $a=(\alpha-1) h$ and $b=(\beta-1) h$. Then we define

$$
\begin{equation*}
y(b+n h):=\left({ }_{a} \Delta_{h, *}^{\alpha} x\right)(n h) \tag{22}
\end{equation*}
$$

Note that $y:(h \mathbb{N})_{b} \rightarrow \mathbb{R}^{N}$. Then we apply the next difference operator of order $\beta$ on the new function $y$ and consider here an initial value problem stated by the system

$$
\begin{gather*}
\left({ }_{a} \Delta_{h, *}^{\alpha} x\right)(n h)=y(b+n h)  \tag{23}\\
\left({ }_{b} \Delta_{h, *}^{\beta} y\right)(n h)=f(n h, x(a+n h)), \tag{24}
\end{gather*}
$$

where $f:(h \mathbb{N})_{0} \times \mathbb{R}^{N} \rightarrow \mathbb{R}^{N}$, with initial values

$$
\begin{gather*}
\left({ }_{a} \Delta_{h, *}^{\alpha} x\right)(0)=x_{0}  \tag{25}\\
x(a)=x_{a} \tag{26}
\end{gather*}
$$

where $x_{a}, x_{0}$ are constant vectors from $\mathbb{R}^{N}$.
Solutions of the state equations (23) and (24) of the sequential fractional discrete-time system can be computed in the recursive way. From Definition 7 and by Proposition 3, (23) can be written as

$$
\begin{aligned}
y & (b+n h) \\
& =\left({ }_{a} \Delta_{h, *}^{\alpha} x\right)(n h)=\left({ }_{a} \Delta_{h}^{-(1-\alpha)}\left(\Delta_{h} x\right)\right)(n h) \\
& =\frac{h}{\Gamma(1-\alpha)} \sum_{k=0}^{n}(n h-a-k h-h)_{h}^{(-\alpha)}\left(\Delta_{h} x\right)(a+k h) \\
& =\frac{h}{\Gamma(1-\alpha)} \sum_{k=0}^{n} h^{-\alpha} \frac{\Gamma(n-k-\alpha+1)}{\Gamma(n-k+1)}\left(\Delta_{h} x\right)(a+k h) \\
& =h^{1-\alpha} \sum_{k=0}^{n}\binom{n-k-\alpha}{n-k}\left(\Delta_{h} x\right)(a+k h)
\end{aligned}
$$

$$
\begin{align*}
&=h^{1-\alpha} \sum_{j=0}^{n}(-1)^{j}\binom{\alpha-1}{j} \\
&= \frac{x(a+(n-j) h+h)-x(a+(n-j) h)}{h} \\
& h^{-\alpha}\{x(a+(n+1) h) \\
&-\left[\binom{\alpha-1}{1}+\binom{\alpha-1}{0}\right] x(a+n h) \\
&+\left[\binom{\alpha-1}{2}+\binom{\alpha-1}{1}\right] x(a+(n-1) h) \\
&-\left[\binom{\alpha-1}{3}+\binom{\alpha-1}{2}\right] x(a+(n-2) h) \\
&+\cdots+(-1)^{n-1}\left[\binom{\alpha-1}{n-1}+\binom{\alpha-1}{n-2}\right] x(a+2 h) \\
&+(-1)^{n}\left[\binom{\alpha-1}{n}+\binom{\alpha-1}{n-1}\right] \\
&\left.\cdot x(a+h)-(-1)^{n}\binom{\alpha-1}{n} x(a)\right\} . \tag{27}
\end{align*}
$$

Since by Proposition 3 the following relation $\binom{\alpha-1}{k}+\binom{\alpha-1}{k-1}=$ $\binom{\alpha}{k}$ holds, one gets

$$
\begin{align*}
& y(b+n h)=h^{-\alpha}[ x(a+(n+1) h)-\binom{\alpha}{1} x(a+n h) \\
&+\binom{\alpha}{2} x(a+(n-1) h) \\
&-\binom{\alpha}{3} x(a+(n-2) h) \\
&+\binom{\alpha}{4} x(a+(n-3) h) \\
&+\cdots+(-1)^{n-1}\binom{\alpha}{n-1} x(a+2 h)  \tag{28}\\
&+(-1)^{n}\binom{\alpha}{n} x(a+h) \\
&\left.\quad-(-1)^{n}\binom{\alpha-1}{n} x(a)\right] \\
&=h^{-\alpha}\left[\begin{array}{l}
\sum_{j=0}^{n}(-1)^{j}\binom{\alpha}{j} x(a+(n-j+1) h) \\
\\
\end{array}+(-1)^{n+1}\binom{\alpha-1}{n} x(a)\right] .
\end{align*}
$$

Repeating the same computation for (24) one gets

$$
\begin{align*}
f(n h, x(a+n h))= & \left({ }_{b} \Delta_{h, *}^{\beta} y\right)(n h)=\left({ }_{b} \Delta_{h}^{-(1-\beta)}\left(\Delta_{h} y\right)\right)(n h) \\
= & h^{-\beta} \sum_{i=0}^{n}(-1)^{i}\binom{\beta}{i} y(b+(n-i+1) h) \\
& +h^{-\beta}(-1)^{n+1}\binom{\beta-1}{n} y(b) . \tag{29}
\end{align*}
$$

Hence,

$$
\begin{align*}
& f(n h, x(a+n h)) \\
& =h^{-\beta} \sum_{i=0}^{n}(-1)^{i}\binom{\beta}{i} \\
& \cdot\left[h^{-\alpha} \sum_{j=0}^{n-i+1}(-1)^{j}\binom{\alpha}{j}\right. \\
& \cdot x(a+(n-i-j+2) h) \\
& \left.\quad+h^{-\alpha}(-1)^{n-i+2}\binom{\alpha-1}{n-i+1} x(a)\right] \\
& +h^{-\beta}(-1)^{n+1}\binom{\beta-1}{n} \cdot x_{0} \\
& =h^{-\alpha-\beta}\left[\sum_{i=0}^{n-i+1} \sum_{j=0}^{n-i+1)^{i+j}\binom{\beta}{i}\binom{\alpha}{j}}\right. \\
& \cdot x(a+(n-i-j+2) h) \\
& \quad+\sum_{i=0}^{n}(-1)^{n-i+2}\binom{\alpha-1}{n-i+1} x(a) \\
& \quad+(-1)^{n+1}\binom{\beta-1}{n} \cdot[x(a+h)-x(a)] \tag{30}
\end{align*}
$$

Then using the Chu-Vandermonde identity, that is, $\sum_{i=0}^{k}\binom{\beta}{i}\binom{\alpha}{k-i}=\binom{\alpha+\beta}{k}, \alpha, \beta \in \mathbb{R}, k \in \mathbb{Z}$, one gets

$$
\begin{aligned}
& h^{\alpha+\beta} \cdot f(n h, x(a+n h)) \\
& =\sum_{k=0}^{n+1}(-1)^{k} \sum_{i=0}^{k}\binom{\beta}{i}\binom{\alpha}{k-i} x(a+(n-k+2) h) \\
& \quad+\left[\sum_{i=0}^{n}(-1)^{n-i}\binom{\alpha-1}{n-i+1}+(-1)^{n}\binom{\beta-1}{n}\right] x(a) \\
& \quad+(-1)^{n+1}\binom{\beta-1}{n} x(a+h)
\end{aligned}
$$

$$
\begin{align*}
= & \sum_{k=0}^{n}(-1)^{k}\binom{\alpha+\beta}{k} x(a+(n-k+2) h) \\
& +(-1)^{n+1}\left[\binom{\alpha+\beta}{n+1}-\binom{\beta}{n+1}+\binom{\beta-1}{n}\right] x(a+h) \\
& +\left[\sum_{i=0}^{n}(-1)^{n-i}\binom{\alpha-1}{n-i+1}+(-1)^{n}\binom{\beta-1}{n}\right] x(a) . \tag{31}
\end{align*}
$$

Then by Proposition 3, we have

$$
\begin{align*}
h^{\alpha+\beta} & f(n h, x(a+n h)) \\
= & \sum_{k=0}^{n}(-1)^{k}\binom{\alpha+\beta}{k} x(a+(n-k+2) h) \\
& +(-1)^{n+1}\left[\binom{\alpha+\beta}{n+1}-\binom{\beta}{n+1}+\binom{\beta-1}{n}\right] x(a+h) \\
& +\left[1+(-1)^{n}\binom{\alpha-2}{n+1}+(-1)^{n} \cdot\binom{\beta-1}{n}\right] x(a) . \tag{32}
\end{align*}
$$

Consequently, since $h^{\alpha} x_{0}=x(a+h)-x(a), x(a+2 h)=$ $h^{\alpha+\beta} \cdot f(0, x(a))-\alpha x(a)+(1+\alpha) \cdot x(a+h)$ and for $n \geq 1$

$$
\begin{align*}
& x(a+(n+2) h) \\
&= h^{\alpha+\beta} \cdot f(n h, x(a+n h)) \\
&+\sum_{k=1}^{n}(-1)^{k+1}\binom{\alpha+\beta}{k} x(a+(n-k+2) h) \\
&+(-1)^{n}\left[\binom{\alpha+\beta}{n+1}-\binom{\beta}{n+1}+\binom{\beta-1}{n}\right] x(a+h) \\
&-\left[1+(-1)^{n}\binom{\alpha-2}{n+1}+(-1)^{n}\binom{\beta-1}{n}\right] x(a) . \tag{33}
\end{align*}
$$

Using Proposition 3 we get for $n \geq 1$

$$
\begin{aligned}
& x(a+(n+2) h) \\
&= h^{\alpha+\beta} \cdot f(n h, x(a+n h)) \\
&+\sum_{k=1}^{n}(-1)^{k+1}\binom{\alpha+\beta}{k} x(a+(n-k+2) h) \\
&+\left[\binom{n-\beta}{n}+\binom{n-\beta}{n+1}-\binom{n-\alpha-\beta}{n+1}\right] x(a+h) \\
&-\left[1-\binom{n-\alpha+2}{n+1}+\binom{n-\beta}{n}\right] x(a)
\end{aligned}
$$

$$
\begin{align*}
= & h^{\alpha+\beta} \cdot f(n h, x(a+n h)) \\
& +\sum_{k=1}^{n}(-1)^{k+1}\binom{\alpha+\beta}{k} x(a+(n-k+2) h) \\
& +\left[\binom{n-\beta+1}{n+1}-\binom{n-\alpha-\beta}{n+1}\right] x(a+h) \\
& -\left[1-\binom{n-\alpha+2}{n+1}+\binom{n-\beta}{n}\right] x(a) . \tag{34}
\end{align*}
$$

Therefore the solution of (23) and (24) is given recursively by the following formula:

$$
\begin{gather*}
x(a+h)=h^{\alpha} x_{0}+x(a), \\
x(a+2 h)=h^{\alpha+\beta} \cdot f(0, x(a))-\alpha x(a) \\
+(1+\alpha) \cdot x(a+h), \\
x(a+(n+2) h) \\
=h^{\alpha+\beta} \cdot f(n h, x(a+n h))  \tag{35}\\
+\sum_{k=1}^{n}(-1)^{k+1}\binom{\alpha+\beta}{k} x(a+(n-k+2) h) \\
+\left[\binom{n-\beta+1}{n+1}-\binom{n-\alpha-\beta}{n+1}\right] x(a+h) \\
+\left[\binom{n-\alpha+2}{n+1}-1-\binom{n-\beta}{n}\right] x(a) .
\end{gather*}
$$

Another possibility of computing the solution of (23) and (24) is to use Proposition 13 twice and then, for $n \geq 1$, we get:

$$
\begin{align*}
\left({ }_{0} \Delta_{h}^{-\beta}\left({ }_{b} \Delta_{h, *}^{\beta} y\right)\right)(b+n h) & =y(b+n h)-y(b) \\
& =\left({ }_{a} \Delta_{h, *}^{\alpha} x\right)(n h)-x_{0}  \tag{36}\\
\left({ }_{0} \Delta_{h}^{-\alpha}\left({ }_{a} \Delta_{h, *}^{\alpha} x\right)\right)(a+n h) & =x(a+n h)-x_{a} .
\end{align*}
$$

Hence

$$
\begin{equation*}
\left({ }_{a} \Delta_{h, *}^{\alpha} x\right)(n h)=x_{0}+\left({ }_{0} \Delta_{h}^{-\beta} \tilde{f}\right)(b+n h) \tag{37}
\end{equation*}
$$

where $\tilde{f}(n h):=f(n h, x(a+n h))$. Nextly,

$$
\begin{equation*}
x(n h+a)=x_{a}+x_{0}\left({ }_{0} \Delta_{h}^{-\alpha} 1\right)(a+n h)+\left({ }_{0} \Delta_{h}^{-\alpha} g\right)(a+n h), \tag{38}
\end{equation*}
$$

where $g(n h)=\left({ }_{0} \Delta_{h}^{-\beta} \tilde{f}\right)(b+n h)$.
Firstly we prove the formula for the unique solution in linear case of (23) and (24): $f(n h, x(n h+a))=A x(a+n h)$, where $A$ is a constant square matrix of degree $n$.

Theorem 14. The solution to the system

$$
\begin{align*}
& \left({ }_{a} \Delta_{h, *}^{\alpha} x\right)(n h)=y(b+n h),  \tag{39}\\
& \left({ }_{b} \Delta_{h, *}^{\beta} y\right)(n h)=A x(a+n h) \tag{40}
\end{align*}
$$

with initial conditions (25) and (26), that is, $\left({ }_{a} \Delta_{h, *}^{\alpha} x\right)(0)=$ $x_{0}$ and $x(a)=x_{a}, x_{0}, x_{a} \in \mathbb{R}^{N}$, is given by the following formula:

$$
\begin{align*}
x(a+n h)= & \sum_{k=0}^{n} A^{k} \varphi_{k, k}((n-2 k) h) x_{a}  \tag{41}\\
& +\sum_{k=0}^{n} A^{k} \varphi_{k+1, k}((n-(2 k+1)) h) x_{0}
\end{align*}
$$

for $n \in \mathbb{N}_{0}$.
Proof. Notice that for $n=0$ we get $x(a+0 \cdot h)=A^{0}\left(\varphi_{0,0}(0) x_{a}+\right.$ $\left.\varphi_{1,0}(-h) x_{0}\right)$. Since $\varphi_{0,0}(0)=1$ and $\varphi_{1,0}(-h)=0$, we get $x(a+$ $0 \cdot h)=x_{a}$.

For $n>0$ let us define the sequence $\left\{x_{m}\right\}_{m \geq 1}$ in the following way:

$$
\begin{align*}
x_{m+1}(a+n h)= & x_{a} \varphi_{0,0}(n h)+x_{0} \varphi_{1,0}((n-1) h)  \tag{42}\\
& +\left({ }_{0} \Delta_{h}^{-\alpha} g_{m}\right)(a+n h), \quad m \in \mathbb{N}_{0}
\end{align*}
$$

where $g_{m}(n h)=\left({ }_{0} \Delta_{h}^{-\beta} \tilde{f}_{m}\right)(b+n h)$ and $\tilde{f}_{m}(n h)=A x_{m}(a+n h)$ with $x_{0}(a+n h)=x_{a}$.

We calculate the first step. As $\tilde{f}_{0}(n h)=A x_{0}(a+n h)=$ $A x_{a}$, then $g_{0}(n h)=A x_{a}\left({ }_{0} \Delta^{-\beta} 1\right)(b+n h)=A x_{a} \varphi_{0,1}((n-1) h)$. Going further,

$$
\begin{align*}
x_{1}(a+n h)= & x_{a} \varphi_{0,0}(n h)+x_{0} \varphi_{1,0}((n-1) h)  \tag{43}\\
& +\left({ }_{0} \Delta_{h}^{-\alpha} g_{0}\right)(a+n h),
\end{align*}
$$

which could be written as

$$
\begin{align*}
x_{1}(a+n h)= & x_{a} \varphi_{0,0}(n h)+x_{0} \varphi_{1,0}((n-1) h) \\
& +A x_{a} \varphi_{1,1}((n-2) h) \tag{44}
\end{align*}
$$

and, using Proposition 11, we get

$$
\begin{align*}
x_{2}(a+n h)= & x_{a} \varphi_{0,0}(n h)+x_{0} \varphi_{1,0}((n-1) h) \\
& +A x_{a} \varphi_{1,1}((n-2) h) \\
& +A x_{0} \varphi_{2,1}((n-3) h)  \tag{45}\\
& +A^{2} x_{a} \varphi_{2,2}((n-4) h) .
\end{align*}
$$

Taking $m$ tending to $+\infty$ we get formula (41) as the solution of (39) and (40) with initial conditions (25) and (26).
3.1. Semilinear Sequential Systems. Firstly we state a technical lemma and notations.

Lemma 15. Let $\gamma:(h \mathbb{N})_{0} \rightarrow \mathbb{R}$ and $\alpha>0$. Let $\left({ }_{0} \Delta_{h}^{-k \alpha} \gamma\right)(k \alpha h+n h)=\gamma_{1}(k \alpha h+n h)$ and $\widetilde{\gamma}_{1}(n h):=\gamma_{1}(k \alpha h+$ nh) for $k \in \mathbb{N}_{1}$. Then for $k \in \mathbb{N}_{1}$ one gets

$$
\begin{equation*}
\left({ }_{0} \Delta_{h}^{-\alpha} \widetilde{\gamma}_{1}\right)(t)=\left({ }_{0} \Delta_{h}^{-(k+1) \alpha} \gamma\right)(k \alpha h+t) \tag{46}
\end{equation*}
$$

where $t=\alpha h+n h$.

Proof. First let us consider the case $k=1$. Then from Proposition 12 we can write

$$
\begin{equation*}
\left({ }_{\alpha h} \Delta_{h}^{-\alpha}\left({ }_{0} \Delta_{h}^{-\alpha} \gamma\right)\right)(t)=\left({ }_{0} \Delta_{h}^{-2 \alpha} \gamma\right)(t) \tag{47}
\end{equation*}
$$

where $t=2 \alpha h+n h, n \in \mathbb{N}_{0}$.
Let $\gamma_{1}(\alpha h+n h)=\left({ }_{0} \Delta_{h}^{-\alpha} \gamma\right)(\alpha h+n h)$ and $\widetilde{\gamma}_{1}(n h):=\gamma_{1}(\alpha h+$ $n h)$. Then

$$
\begin{align*}
& \left({ }_{0} \Delta_{h}^{-\alpha} \widetilde{\gamma}_{1}\right)(\alpha h+n h) \\
& \quad=\frac{h}{\Gamma(\alpha)} \sum_{r=0}^{n}(n h+\alpha h-\sigma(r h))_{h}^{(\alpha-1)} \widetilde{\gamma}_{1}(r h) \\
& \quad=\frac{h}{\Gamma(\alpha)} \sum_{s=\alpha}^{n+\alpha}(n h+2 \alpha h-\sigma(s h))_{h}^{(\alpha-1)} \gamma_{1}(s h)  \tag{48}\\
& \quad=\left({ }_{\alpha h} \Delta_{h}^{-\alpha} \gamma_{1}\right)(2 \alpha h+n h) \\
& \quad=\left({ }_{0} \Delta_{h}^{-2 \alpha} \gamma\right)(2 \alpha h+n h) .
\end{align*}
$$

Equation (46) for $k>1$ follows inductively.
Note that

$$
\begin{align*}
& \left({ }_{0} \Delta_{h}^{-k \alpha} \gamma\right)(k \alpha h+n h) \\
& \quad=\frac{h}{\Gamma(k \alpha)} \sum_{r=0}^{n}(n h+k \alpha h-\sigma(r h))_{h}^{(k \alpha-1)} \gamma(r h) . \tag{49}
\end{align*}
$$

Similar to the procedure presented in the proof of Lemma 15 we can prove that for $k, s \in \mathbb{N}_{0}$ and $\alpha>0, \beta>0$ :

$$
\begin{align*}
& \left({ }_{0} \Delta_{h}^{-k \alpha-s \beta} \gamma\right)(k \alpha h+s \beta h+n h) \\
& \quad=\frac{h}{\Gamma(k \alpha+s \beta)} \sum_{r=0}^{n}((n+k \alpha+s \beta-r-1) h)_{h}^{(k \alpha+s \beta-1)} \gamma(r h) \\
& \quad=h^{k \alpha+s \beta} \sum_{r=0}^{n} \frac{\Gamma(n-r+k \alpha+s \beta)}{\Gamma(k \alpha+s \beta) \Gamma(n-r+1)} \gamma(r h) \\
& \quad=\sum_{r=0}^{n}\binom{n-r+k \alpha+s \beta-1}{n-r} h^{k \alpha+s \beta} \gamma(r h) . \tag{50}
\end{align*}
$$

Taking $\mu=k \alpha+s \beta$ and using formula (38) we can write (50) shortly in the following way:

$$
\begin{equation*}
\left({ }_{0} \Delta_{h}^{-\mu} \gamma\right)(\mu h+n h)=\sum_{r=0}^{n} \widetilde{\varphi}_{k, s}(n h-r h) \gamma(r h) \tag{51}
\end{equation*}
$$

Moreover, we can also write direct formula for values $\left({ }_{0} \Delta_{h}^{-\alpha} g\right)(n h+a)$ given in (38) for nonlinear problem. In fact using Definition 4 of fractional summation, formula (38) of functions $\widetilde{\varphi}_{k, s}$ and Proposition 12 we write (51) as follows:

$$
\begin{align*}
x(a+n h)= & x_{a}+x_{0}\left({ }_{0} \Delta_{h}^{-\alpha} 1\right)(a+n h) \\
& +\sum_{r=0}^{n-1} \widetilde{\varphi}_{1,1}(n h-h-\sigma(r h)) f(r h, x(a+r h)) \tag{52}
\end{align*}
$$

Using the power rule formula for $\mu=0$ and by Remark 10 we can write the recursive formula for the solution to nonlinear problem given by (23) and (24) and conditions (25) and (26):

$$
\begin{align*}
x(a+n h)= & x_{a}+x_{0} \varphi_{1,0}((n-1) h) \\
& +\sum_{r=0}^{n-1} \widetilde{\varphi}_{1,1}(n h-h-\sigma(r h)) f(r h, x(a+r h)) . \tag{53}
\end{align*}
$$

The given formula (53) also works for $n=0$ as $\widetilde{\varphi}_{1,1}(-2 h)=0$. Then $x(a+0 h)=x_{a}$. We can check the next steps:

$$
\begin{align*}
x(a+h) & =x_{a}+x_{0} \varphi_{1,0}(0)+\widetilde{\varphi}_{1,1}(-h) f(0, x(a)) \\
& =x_{a}+x_{0} h^{\alpha} \\
x(a+2 h) & =x_{a}+x_{0} \varphi_{1,0}(h)+\widetilde{\varphi}_{1,1}(0 h) f(0, x(a)) \tag{54}
\end{align*}
$$

$$
+\widetilde{\varphi}_{1,1}(-h) f(h, x(a+h))
$$

$$
=x_{a}+x_{0} h^{\alpha}(1+\alpha)+h^{\alpha+\beta} f(0, x(a))
$$

For special semilinear case when $f(n h, x(n h+a))=A x(n h+$ $a)+\gamma(n h)$ we have $f(0, x(a))=A x(a)+\gamma(0)$. Then

$$
\begin{equation*}
x(a+2 h)=\left(I+h^{\alpha+\beta} A\right) x_{a}+(1+\alpha) h^{\alpha} x_{0}+h^{\alpha+\beta} \gamma(0) \tag{55}
\end{equation*}
$$

Theorem 16. The solution to the system

$$
\begin{gather*}
\left({ }_{a} \Delta_{h, *}^{\alpha} x\right)(n h)=y(b+n h)  \tag{56}\\
\left({ }_{b} \Delta_{h, *}^{\beta} y\right)(n h)=A x(a+n h)+\gamma(n h) \tag{57}
\end{gather*}
$$

with initial conditions (25) and (26), that is, $\left({ }_{a} \Delta_{h, *}^{\alpha} x\right)(0)=x_{0}$ and $x(a)=x_{a}, x_{0}, x_{a} \in \mathbb{R}^{N}$ is given by

$$
\begin{align*}
x(a & +n h) \\
= & \sum_{k=0}^{n} A^{k} \varphi_{k, k}((n-2 k) h) x_{a} \\
& +\sum_{k=0}^{n} A^{k} \varphi_{k+1, k}((n-(2 k+1)) h) x_{0} \\
& +\sum_{r=0}^{n-1}\left(\sum_{k=0}^{n} A^{k} \widetilde{\varphi}_{k+1, k+1}((n-1) h-\sigma(r h))\right) \gamma(r h), \tag{58}
\end{align*}
$$

for $n \in \mathbb{N}_{0}$.
Proof. Note that $\varphi_{0,0}(0)=1, \varphi_{1,0}(-h)=0$ and $\varphi_{k+1, k+1}(-h)$ $=0$ for $k \geq 0$, so we get $x(a+0 h)=x_{a}$.

For $n>0$ based on the proof for linear case we can write the solution formula as follows:

$$
\begin{align*}
x(a+n h)= & \sum_{k=0}^{n} A^{k} \varphi_{k, k}((n-2 k) h) x_{a} \\
& +\sum_{k=0}^{n} A^{k} \varphi_{k+1, k}((n-(2 k+1)) h) x_{0}  \tag{59}\\
& +\sum_{k=0}^{n} A^{k}\left({ }_{0} \Delta_{h}^{-\tau} \gamma\right)((n-1+\tau) h),
\end{align*}
$$

where $\tau=(k+1)(\alpha+\beta)$. Then taking into account formulas (50) and (51) we get the form (58) as the solution of (56) and (57) with initial conditions (25) and (26).

## 4. Positivity

Let $\mathbb{R}_{+}^{N \times M}$ be the set of real $N \times M$ matrices with the nonnegative entries and $\mathbb{R}_{+}^{N}=\mathbb{R}_{+}^{N \times 1}$.

Based on $[8,31,32]$ we consider the following definitions.
Definition 17. The fractional system (23) and (24) is called positive fractional system if and only if $x(a+n h) \in \mathbb{R}_{+}^{N}$ for any initial conditions $x_{a}, x_{0} \in \mathbb{R}_{+}^{N}$.

Similarly as in [32] we will use the recursive formula (35) to show the positivity of the considered systems. Observe that the systems considered in this paper are of the sequential type while in [32] the sequential systems are not studied. Moreover, the Grünwald-Letnikov operator with the step equal to one is used in [32], whereas we study the systems with the $h$-differences of Caputo type. So in our case the steps are equal to $h$.

From [32] we have the following lemma.
Lemma 18. If $0<\alpha<1$, then $(-1)^{i+1}\binom{\alpha}{i}>0, i=1,2,3, \ldots$.
Moreover, for $k \geq 3$ we have $\binom{1}{k}=0$.
Using the properties of Euler gamma function one can show that if $0<\alpha+\beta \leq 1$, then for $n \in \mathbb{N}_{1}$, one has the following inequality:

$$
\begin{equation*}
\binom{n-\beta}{n+1}+\binom{n-\alpha+2}{n+1} \geq\binom{ n-\alpha-\beta}{n+1}+\binom{n+1}{n+1} \tag{60}
\end{equation*}
$$

Proposition 19. Let $0<\alpha+\beta \leq 1$. If $x_{0}, x_{a} \in \mathbb{R}_{+}^{N}$ and for all $n \geq 0, \bar{x} \in \mathbb{R}_{+}^{N}$

$$
\begin{equation*}
h^{\alpha+\beta} f(n h, \bar{x})-\binom{\alpha+\beta}{2} \bar{x} \in \mathbb{R}_{+}^{N} \tag{61}
\end{equation*}
$$

then $x(a+n h) \in \mathbb{R}_{+}^{N}$ for all $n \geq 1$.
Proof. The proof is by the induction principle. Assume that $0<\alpha+\beta \leq 1$ and both $\alpha>0$ and $\beta>0$. Since $x_{0}, x_{a} \in \mathbb{R}_{+}^{N}$ and $h>0$, by (35) we have

$$
\begin{equation*}
x(a+h)=h^{\alpha} x_{0}+x_{a} \in \mathbb{R}_{+}^{N} . \tag{62}
\end{equation*}
$$

Moreover,

$$
\begin{equation*}
x_{i}(a+h) \geq x_{a}^{i}=x_{i}(a) \tag{63}
\end{equation*}
$$

where $x(a+h)=\left[x_{1}(a+h), \ldots, x_{N}(a+h)\right]^{T}$ and $x(a)=$ $\left[x_{1}(a), \ldots, x_{N}(a)\right]^{T}=\left[x_{a}^{1}, \ldots, x_{a}^{N}\right]^{T}$. Let $x_{i}(a+n h)$ and $f_{i}(n h, x(a+n h))$ denote the $i$ th coordinates of the vectors $x(a+n h)$ and $f(n h, x(a+n h))$, respectively. Then since $x_{i}(a+$ $h) \geq x_{i}(a) \geq 0$ for $i=1, \ldots, N$,

$$
\begin{align*}
x_{i}(a+2 h)= & h^{\alpha+\beta} \cdot f_{i}(0, x(a)) \\
& -\alpha x_{i}(a)+(1+\alpha) \cdot x_{i}(a+h) \\
\geq & h^{\alpha+\beta} \cdot f_{i}(0, x(a))-\alpha x_{i}(a)+(1+\alpha) \cdot x_{i}(a) \\
= & h^{\alpha+\beta} \cdot f_{i}(0, x(a))+x_{i}(a) \tag{64}
\end{align*}
$$

Note that for $0<\alpha+\beta \leq 1$ we have $-(1 / 8) \leq\binom{\alpha+\beta}{2} \leq 0$, so $\binom{\alpha+\beta}{2}+1 \geq 0$. Then since $x_{i}(a) \geq 0$ and (61) holds for $n=0$, we get

$$
\begin{equation*}
x_{i}(a+2 h) \geq\left[\binom{\alpha+\beta}{2}+1\right] x_{i}(a) \geq 0 \tag{65}
\end{equation*}
$$

For $n=1$ we have

$$
\begin{align*}
x_{i}(a+3 h)= & h^{\alpha+\beta} \cdot f_{i}(h, x(a+h))-\binom{\alpha+\beta}{2} \\
& \cdot x_{i}(a+h)+(\alpha+\beta) \cdot x_{i}(a+2 h)+\binom{2-\beta}{2} \\
& \cdot x(a+h)+\left[\binom{3-\alpha}{2}-1-(1-\beta)\right] x_{i}(a) . \tag{66}
\end{align*}
$$

Since $\binom{2-\beta}{2}>0, x_{i}(a+h) \geq x_{i}(a) \geq 0$ for $i=1, \ldots, N$, and (61) holds for $n=1$, we have

$$
\begin{equation*}
x_{i}(a+3 h) \geq\left[\binom{2-\beta}{2}+\binom{3-\alpha}{2}+\beta\right] x_{i}(a) \geq 0 \tag{67}
\end{equation*}
$$

for $0<\alpha, \beta \leq 1$.
Now for $n=2$ we get

$$
\begin{align*}
x_{i}(a+4 h)= & h^{\alpha+\beta} \cdot f_{i}(2 h, x(a+2 h)) \\
& -\binom{\alpha+\beta}{2} x_{i}(a+2 h)+(\alpha+\beta) \cdot x_{i}(a+3 h) \\
& +\left[\binom{3-\beta}{3}-\binom{2-\alpha-\beta}{3}\right] x(a+h) \\
& +\left[\binom{4-\alpha}{3}-1-\binom{2-\beta}{2}\right] x_{i}(a) . \tag{68}
\end{align*}
$$

Since $\binom{3-\beta}{3}-\binom{2-\alpha-\beta}{3}>0$ for $0<\alpha, \beta \leq 1, x_{i}(a+h) \geq$ $x_{i}(a) \geq 0$ for $i=1, \ldots, N$, and (61) holds for $n=2$, using (60) we have

$$
\begin{align*}
x_{i}(a+4 h) \geq & {\left[\binom{3-\beta}{3}+\binom{4-\alpha}{3}\right.} \\
& \left.-\binom{2-\alpha-\beta}{3}-\binom{3}{3}\right] x_{i}(a) \geq 0 \tag{69}
\end{align*}
$$

for $0<\alpha, \beta \leq 1$.
Assume that $x(a+k h) \in \mathbb{R}_{+}^{N}$ for $k=1,2,3, \ldots, n+1$. Using the properties of gamma function one can show that $\binom{n-\beta+1}{n+1} \geq\binom{ n-\alpha-\beta}{n+1}$ for $n \geq 3$. Then applying $x(a+h) \geq x(a)$ to (35) we get for $n \geq 3$

$$
x_{i}(a+(n+2) h)
$$

$$
=h^{\alpha+\beta} \cdot f_{i}(n h, x(a+n h))-\binom{\alpha+\beta}{2} x_{i}(a+n h)
$$

$$
+(\alpha+\beta) x_{i}(a+(n+1) h)
$$

$$
+\sum_{k=3}^{n}(-1)^{k+1}\binom{\alpha+\beta}{k} x_{i}(a+(n-k+2) h)
$$

$$
+\left[\binom{n-\beta+1}{n+1}-\binom{n-\alpha-\beta}{n+1}\right] x_{i}(a+h)
$$

$$
+\left[\binom{n-\alpha+2}{n+1}-1-\binom{n-\beta}{n}\right] x_{i}(a)
$$

$$
\geq h^{\alpha+\beta} \cdot f(n h, x(a+n h))-\binom{\alpha+\beta}{2} x_{i}(a+n h)
$$

$$
+(\alpha+\beta) x(a+(n+1) h)
$$

$$
\begin{equation*}
+\sum_{k=3}^{n}(-1)^{k+1}\binom{\alpha+\beta}{k} x_{i}(a+(n-k+2) h) \tag{70}
\end{equation*}
$$

$$
+\left[\binom{n-\beta+1}{n+1}-\binom{n-\alpha-\beta}{n+1}\right.
$$

$$
\left.+\binom{n-\alpha+2}{n+1}-1-\binom{n-\beta}{n}\right] x_{i}(a)
$$

$$
=h^{\alpha+\beta} \cdot f(n h, x(a+n h))-\binom{\alpha+\beta}{2} x_{i}(a+n h)
$$

$$
+(\alpha+\beta) x(a+(n+1) h)
$$

$$
+\sum_{k=3}^{n}(-1)^{k+1}\binom{\alpha+\beta}{k} x_{i}(a+(n-k+2) h)
$$

$$
+\left[\binom{n-\beta}{n+1}-\binom{n-\alpha-\beta}{n+1}\right.
$$

$$
\left.+\binom{n-\alpha+2}{n+1}-\binom{n+1}{n+1}\right] x_{i}(a)
$$

By inequality (60) and the assumptions, that is, $x(a+k h) \epsilon$ $\mathbb{R}_{+}^{N}, k \leq n+1$, and by $(61)$ one gets $x(a+(n+2) h) \in \mathbb{R}_{+}^{N}$. Hence

Figure 1: Consider the following system $\left({ }_{a} \Delta_{h, *}^{0.4} x\right)(n h)=y(b+n h)$, $\left({ }_{b} \Delta_{h, *}^{0.5} y\right)(n h)=A x(a+n h)$, where $A$ is given in Example 22, with initial conditions: $x_{0}=(0,1), x_{a}=(0,0.1), h^{0.9} A-\binom{0.9}{2} I_{2} \in \mathbb{R}_{+}^{2 \times 2}$.
using the induction principle we get that $x(a+n h) \in \mathbb{R}_{+}^{N}$ for all $n \geq 1$.

Corollary 20. Let $0<\alpha+\beta \leq 1$ and $I_{N}$ denote the identity matrix. If $x_{0}, x_{a} \in \mathbb{R}_{+}^{N}$ and for all $n \geq 1, \bar{x} \in \mathbb{R}_{+}^{N}$

$$
\begin{equation*}
h^{\alpha+\beta} A-\binom{\alpha+\beta}{2} I_{N} \in \mathbb{R}_{+}^{N \times N} \tag{71}
\end{equation*}
$$

then $x(a+n h) \in \mathbb{R}_{+}^{N}$ for all $n \geq 1$ that is, (39) and (40) is positive.

Remark 21. In [32] the sufficient condition concerning the positivity of the linear discrete systems with GrünwaldLetnikov operator is as follows: $A+\alpha I_{N} \in \mathbb{R}_{+}^{N \times N}$. In our case since we have systems with the sequential fractional $h$ difference, in our condition $h$ and both orders $\alpha$ and $\beta$ appear. Note that taking $h=1$ the sufficient condition (71) has the form $A-\binom{\alpha+\beta}{2} I_{N} \in \mathbb{R}_{+}^{N \times N}$.

Let us now consider some examples that illustrate the solution of the considered systems.

Example 22. Let $N=2, \alpha=0.4, \beta=0.5$ and $h=0.01$. Then let us take $a=-0.006$ and $b=-0.005$ and consider the linear system with sequential difference in the following form:

$$
\begin{align*}
& \left({ }_{a} \Delta_{h, *}^{0.4} x\right)(n h)=y(b+n h), \\
& \left({ }_{b} \Delta_{h, *}^{0.5} y\right)(n h)=A x(a+n h) \tag{72}
\end{align*}
$$

with initial conditions (25) and (26), that is, $\left({ }_{a} \Delta_{h, *}^{\alpha} x\right)(0)=x_{0}$ and $x(a)=x_{a}, x_{0}, x_{a} \in \mathbb{R}^{2}$. Moreover let $A=\left[\begin{array}{cc}-2 & 1 \\ 1 & -2\end{array}\right]$ and $B=\left[\begin{array}{cc}-4 & 1 \\ 1 & -2\end{array}\right]$. Then the matrix $h^{\alpha+\beta} A-\binom{\alpha+\beta}{2} I_{2}$ has

Figure 2: Consider the following system $\left({ }_{a} \Delta_{h, *}^{0.4} x\right)(n h)=y(b+n h)$, $\left({ }_{b} \Delta_{h, *}^{0.5} y\right)(n h)=B x(a+n h)$, where $B$ is given in Example 22, with initial conditions: $x_{0}=(0,1), x_{a}=(0,0.1), h^{0.9} A-\binom{0.9}{2} I_{2} \notin \mathbb{R}_{+}^{2 \times 2}$.
nonnegative values and the fact of staring from nonnegative initial conditions provides the remaining in the same positive cone. In Figure 1 we present the trajectory for $T=500$ steps on the $\left(x_{1}, x_{2}\right)$-plane that start from $x_{a}=(0,0.1)$ and with the initial value $x_{0}=(0,1)$. Let us notice that in the case $h^{\alpha+\beta} B-\binom{\alpha+\beta}{2} I_{2} \notin \mathbb{R}_{+}^{2 \times 2}$ one can see that in a few initial steps points are escaping from the positive area (see Figure 2). All calculations were done in the Maple program.

## 5. Conclusions

The behaviour of the solutions of systems with sequential fractional difference is studied. We present recursive formulas for nonlinear systems and give the exact formulas for the unique solutions to systems in linear and semilinear cases. We prove the sufficient condition for the positivity of considered systems.

Our future goal is to study stability of systems with sequential fractional differences.

## Acknowledgments

This project was supported by the foundayion of the National Science Centre granted on the bases of the decision. The DEC-2011/03/B/ST7/03476. This work was supported by Bialystok University of Technology Grant no. G/WM/3/2012.
