

ON SELF-INJECTIVE DIMENSIONS OF ARTINIAN RINGS

By

Mitsuo HOSHINO

Throughout this note R stands for a left and right artinian ring unless specified otherwise. We denote by $\text{mod } R$ (resp. $\text{mod } R^{\text{op}}$) the category of all finitely generated left (resp. right) R -modules and by $()^*$ both the R -dual functors. For an $X \in \text{mod } R$, we denote by $\varepsilon_X: X \rightarrow X^{**}$ the usual evaluation map, by $E(X)$ its injective envelope and by $[X]$ its image in $K_0(\text{mod } R)$, the Grothendieck group of $\text{mod } R$.

In this note, we ask when $\text{inj dim } {}_R R = \text{inj dim } R_R$. Note that if $\text{inj dim } {}_R R < \infty$ and $\text{inj dim } R_R < \infty$ then by Zaks [10, Lemma A] $\text{inj dim } {}_R R = \text{inj dim } R_R$. So we ask when $\text{inj dim } R_R < \infty$ implies $\text{inj dim } {}_R R < \infty$. There has not been given any example of R with $\text{inj dim } {}_R R \neq \text{inj dim } R_R$. However, we know only a little about the question. By Eilenberg and Nakayama [5, Theorem 18], ${}_R R$ is injective if and only if so is R_R . In case R is an artin algebra, we know from the theory of tilting modules that $\text{inj dim } {}_R R \leq 1$ if and only if $\text{inj dim } R_R \leq 1$ (see Bongartz [3, Theorem 2.1]). Also, if R is of finite representation type, it is well known and easily checked that $\text{inj dim } {}_R R < \infty$ if and only if $\text{inj dim } R_R < \infty$.

Suppose $\text{inj dim } R_R < \infty$. Then we have a well defined linear map

$$\delta: K_0(\text{mod } R^{\text{op}}) \longrightarrow K_0(\text{mod } R)$$

such that

$$\delta([M]) = \sum_{i \geq 0} (-1)^i [\text{Ext}_R^i(M, R)]$$

for $M \in \text{mod } R^{\text{op}}$. Since R is artinian, both $K_0(\text{mod } R^{\text{op}})$ and $K_0(\text{mod } R)$ are finitely generated free abelian groups of the same rank. Also, for an $M \in \text{mod } R^{\text{op}}$, $[M] = 0$ if and only if $M = 0$. Thus $\text{inj dim } {}_R R < \infty$ if (and only if) the following two conditions are satisfied:

- (a) δ is surjective.
- (b) There is an integer $d \geq 1$ such that $\delta([\text{Ext}_R^d(X, R)]) = 0$ for all $X \in \text{mod } R$.

In this note, along the principle above, we will prove the following

THEOREM A. *Let $m, n \geq 1$. Suppose that $\text{inj dim } R_R \leq n$ and that for all $0 \leq i \leq n-2$ (if $n \geq 2$) $\text{Ext}_R^i(\text{Ext}_R^m(-, R), R)$ vanishes on $\text{mod } R$. Then $\text{inj dim } R_R < \infty$.*

REMARK. Let $0 \rightarrow R_R \rightarrow E_0 \rightarrow E_1 \rightarrow \dots$ be a minimal injective resolution of R_R . Suppose $\text{proj dim } E_i < m$ for all $0 \leq i \leq n-2$. Then it follows by Cartan and Eilenberg [4, Chap. VI, Proposition 5.3] that for all $0 \leq i \leq n-2$ $\text{Ext}_R^i(\text{Ext}_R^m(-, R), R)$ vanishes on $\text{mod } R$. The converse fails. Namely, there has been given an example of R such that $\text{proj dim } E_0 = \infty$ and $\text{Ext}_R^1(-, R)^*$ vanishes on $\text{mod } R$ (see Hoshino [7, Example]).

Consider the case $n=1$ in Theorem A. Then the last assumption is empty and we get the following

COROLLARY. *$\text{inj dim } R_R \leq 1$ if and only if $\text{inj dim } R_R \leq 1$.*

As another application of Theorem A, we will prove the following

THEOREM B. *Let $0 \rightarrow R_R \rightarrow E_0 \rightarrow E_1 \rightarrow \dots$ be a minimal injective resolution of R_R . Suppose $\text{inj dim } R_R \leq 2$. Then the following statements are equivalent.*

- (1) $\text{inj dim } R_R < \infty$.
- (2) $\text{proj dim } E_0 < \infty$.
- (3) $\text{proj dim } E_2 < \infty$.

The following question is raised: Does $\text{inj dim } R_R < \infty$ imply $\text{proj dim } E(R_R) < \infty$? If this is the case, it would follow from Theorem B that $\text{inj dim } R_R \leq 2$ if and only if $\text{inj dim } R_R \leq 2$. At least, it would be possible to check directly that $\text{inj dim } R_R \leq 1$ implies $\text{proj dim } E(R_R) \leq 1$. In connection with this, we notice that $\text{proj dim } E(R_R) \leq 1$ does not imply $\text{proj dim } E(R_R) < \infty$ (see Hoshino [7, Example]).

1. Proof of Theorem A

We may assume $m > n$. We claim $\text{inj dim } R_R \leq m+n-2$. Let

$$\dots \longrightarrow P_1 \longrightarrow P_0 \longrightarrow X \longrightarrow 0$$

be an exact sequence in $\text{mod } R$ with the P_i projective. Put $X_i = \text{Cok}(P_{i+1} \rightarrow P_i)$ for $i \geq 0$ and $M_i = \text{Cok}(P_{i-1}^* \rightarrow P_i^*)$ for $i \geq 1$. As remarked in the introduction, we have only to check the following two conditions:

- (a)' $[X] = \delta \left(\sum_{i=0}^{m+n-3} (-1)^i [P_i^*] + (-1)^{m+n-2} [X_{m+n-2}^*] \right)$.
- (b)' $\text{Ext}_R^i(\text{Ext}_R^{m+n-1}(X, R), R) = 0$ for all $i \geq 0$.

We will check these in several steps.

STEP 1: $M_i^{**} \cong X_{i+1}^* \cong \text{Ker}(P_{i+1}^* \rightarrow P_{i+2}^*)$ for all $i \geq 1$.

PROOF. Let $i \geq 1$. Since each P_j is reflexive, we have

$$\begin{aligned} M_i^* &\cong \text{Ker}(P_i^{**} \rightarrow P_{i-1}^{**}) \\ &\cong \text{Ker}(P_i \rightarrow P_{i-1}) \\ &\cong \text{Cok}(P_{i+2} \rightarrow P_{i+1}). \end{aligned}$$

Applying $()^*$, the assertion follows.

STEP 2: For each $i \geq 1$, there is the following commutative diagram with exact rows:

$$\begin{array}{ccccccccc} 0 & \longrightarrow & \text{Ext}_R^i(X, R) & \longrightarrow & M_i & \xrightarrow{\varepsilon_{M_i}} & M_i^{**} & \longrightarrow & \text{Ext}_R^{i+1}(X, R) & \longrightarrow & 0 \\ & & \parallel & & \parallel & & \downarrow & & \downarrow & & \\ (e_i): 0 & \longrightarrow & \text{Ext}_R^i(X, R) & \longrightarrow & M_i & \xrightarrow{\phi_i} & P_{i+1}^* & \longrightarrow & M_{i+1} & \longrightarrow & 0. \end{array}$$

PROOF. This is a consequence of Auslander [1, Proposition 6.3]. However, for the benefit of the reader, we provide a direct proof. By Step 1 we have the following commutative diagram with exact rows and columns:

$$\begin{array}{ccccccc} & & P_{i-1}^* & & P_{i+2}^* & & \\ & & \downarrow & & \uparrow & & \\ & & P_i^* & \longrightarrow & P_{i+1}^* & \longrightarrow & M_{i+1} \longrightarrow 0 \\ & & \downarrow & & \uparrow & & \\ & & M_i & \xrightarrow{\varepsilon_{M_i}} & M_i^{**} & & \\ & & \downarrow & & \uparrow & & \\ & & 0 & & 0 & & \end{array}$$

Since the $\text{Ext}_R^i(-, R)$ are derived functors of $()^*$, the assertion follows.

STEP 3: $\text{Ext}_R^1(M_i, R) = 0$ for all $i \geq 2$.

PROOF. Let $i \geq 2$. Note that X_{i-1} is torsionless. We have a finite presentation $P_{i-1}^* \rightarrow P_i^* \rightarrow M_i \rightarrow 0$ with $X_{i-1} \cong \text{Cok}(P_i^{**} \rightarrow P_{i-1}^{**})$. Thus by Step 2 $\text{Ext}_R^1(M_i, R) \cong \text{Ker } \varepsilon_{X_{i-1}} = 0$.

STEP 4: Suppose $n \geq 2$. Then $\text{Ext}_R^{j+1}(M_{i+j}, R) = 0$ for all $i \geq m$ and $n-1 \geq j \geq 1$.

PROOF. Note that for all $i \geq m$ and $n-2 \geq j \geq 0$ $\text{Ext}_R^j(\text{Ext}_R^k(-, R), R)$ vanishes on mod R . Let $i \geq m$. Applying $(\)^*$ to exact sequences $(e_i), \dots, (e_{i+n-2})$ in Step 2, we get a chain of embeddings:

$$\text{Ext}_R^n(M_{i+n-1}, R) \hookrightarrow \dots \hookrightarrow \text{Ext}_R^1(M_i, R).$$

By Step 3 the assertion follows.

STEP 5: $\text{Ext}_R^j(M_i, R) = 0$ for all $i \geq m+n-1$ and $j \geq 1$.

PROOF. Note that for all $j \geq n+1$ $\text{Ext}_R^j(-, R)$ vanishes on mod R^{op} . By Steps 3 and 4 the assertion follows.

STEP 6: X_i is reflexive for all $i \geq m+n-2$.

PROOF. Let $i \geq m+n-2$. Since $m+n-2 \geq 1$, X_i is torsionless. Also, as in the proof of Step 3, we have $\text{Cok } \varepsilon_{X_i} \cong \text{Ext}_R^2(M_{i+1}, R)$. By Step 5 the assertion follows.

STEP 7: $\text{Ext}_R^j(X_i^*, R) = 0$ for all $i \geq m+n-2$ and $j \geq 1$.

PROOF. Note that X_i^* is a second syzygy of M_{i+1} . By Step 5 the assertion follows.

STEP 8: $[X] = \delta\left(\sum_{j=0}^{i-1} (-1)^j [P_j^*] + (-1)^i [X_i^*]\right)$ for all $i \geq m+n-2$.

PROOF. Let $i \geq m+n-2$. By Steps 6 and 7 we have

$$\begin{aligned} [X] &= \sum_{j=0}^{i-1} (-1)^j [P_j] + (-1)^i [X_i] \\ &= \sum_{j=0}^{i-1} (-1)^j [P_j^{**}] + (-1)^i [X_i^{**}] \\ &= \sum_{j=0}^{i-1} (-1)^j \delta([P_j^*]) + (-1)^i \delta([X_i^*]) \\ &= \delta\left(\sum_{j=0}^{i-1} (-1)^j [P_j^*] + (-1)^i [X_i^*]\right). \end{aligned}$$

STEP 9: $\text{Ext}_R^j(\text{Ext}_R^i(X, R), R)=0$ for all $i \geq m+n-1$ and $j \geq 0$.

PROOF. Let $i \geq m+n-1$. Observe the commutative diagram in Step 2. It is not difficult to see that ϕ_i^* is epic. Thus, by applying $()^*$ to the exact sequence (e_i) , the assertion follows by Step 5.

This finishes the proof of Theorem A.

2. Proof of Theorem B

We will use a result of Cartan and Eilenberg [4, Chap. VI, Proposition 5.3] without any reference.

(1) \Rightarrow (2) and (3). See Iwanaga [8, Proposition 1].

(2) \Rightarrow (1). Let $m \geq 1$ and $X \in \text{mod } R$. Suppose $\text{proj dim } E_0 < m$. Then $\text{Hom}_R(\text{Ext}_R^m(X, R), E_0) \cong \text{Tor}_m^R(E_0, X) = 0$ and thus $\text{Ext}_R^m(X, R)^* = 0$. Hence Theorem A applies.

(3) \Rightarrow (1). Let $m \geq 2$ and suppose $\text{proj dim } E_2 < m$. We claim that $\text{Ext}_R^m(-, R)^*$ vanishes on $\text{mod } R$. Let

$$\cdots \longrightarrow P_1 \longrightarrow P_0 \longrightarrow X \longrightarrow 0$$

be an exact sequence in $\text{mod } R$ with the P_i projective and put $M = \text{Cok}(P_{m-1}^* \rightarrow P_m^*)$. Note first that for all $i \geq m$, since $\text{Hom}_R(\text{Ext}_R^i(X, R), E_2) \cong \text{Tor}_i^R(E_2, X) = 0$, $\text{Ext}_R^2(\text{Ext}_R^i(X, R), R) = 0$. By Step 2 of Section 1 we have an exact sequence

$$0 \longrightarrow \text{Ext}_R^m(X, R) \longrightarrow M \xrightarrow{\varepsilon_M} M^{**} \longrightarrow \text{Ext}_R^{m+1}(X, R) \longrightarrow 0.$$

Note that by Step 3 of Section 1 $\text{Ext}_R^1(M, R) = 0$, that since M^{**} is a second syzygy, $\text{Ext}_R^i(M^{**}, R) = 0$ for all $i \geq 1$, and that ε_M^* is epic. Applying $()^*$ to the above exact sequence, we get

$$\begin{aligned} \text{Ext}_R^m(X, R)^* &\cong \text{Ext}_R^1(\text{Im } \varepsilon_M, R) \\ &\cong \text{Ext}_R^2(\text{Ext}_R^{m+1}(X, R), R) \\ &= 0, \end{aligned}$$

as required.

3. Remarks

In this and the next sections, we will make some remarks on our subject.

PROPOSITION 1. Let $\cdots \rightarrow P_1 \rightarrow P_0 \rightarrow X \rightarrow 0$ be an exact sequence in $\text{mod } R$ with the P_i projective. Put $X_i = \text{Cok}(P_{i+1} \rightarrow P_i)$ for $i \geq 0$. Then for each $n \geq 1$ the

following equality holds in $K_0(\text{mod } R^{\text{op}})$:

$$\sum_{i=0}^n (-1)^i [\text{Ext}_R^i(X, R)] = \sum_{i=0}^{n-1} (-1)^i [P_i^*] + (-1)^n [X_n^*].$$

PROOF. By direct calculation.

PROPOSITION 2. *Suppose $\text{inj dim } R_R \leq 2$ and $\text{proj dim } E({}_R R) \leq 1$. Then $\text{inj dim } {}_R R \leq 2$.*

PROOF. By Hoshino [7, Proposition D] $\text{Ext}_R^1(-, R)^*$ vanishes on $\text{mod } R$. Thus by Theorem A and Zaks [10, Lemma A] the assertion follows.

PROPOSITION 3. *The following statements are equivalent.*

- (1) $\text{inj dim } {}_R R \leq 1$.
- (2) $\text{inj dim } R_R \leq 1$.
- (3) *Every $X \in \text{mod } R$ with $\text{Ext}_R^1(X, R) = 0$ is torsionless.*
- (4) *Every $M \in \text{mod } R^{\text{op}}$ with $\text{Ext}_R^1(M, R) = 0$ is torsionless.*

PROOF. (1) \Leftrightarrow (2). By Corollary to Theorem A.

(1) \Leftrightarrow (4) and (2) \Leftrightarrow (3). See Hoshino [6, Remark].

4. Appendix

In this section, as an appendix, we deal with the case of R being noetherian.

We remarked in [6] that for a left and right noetherian ring R , $\text{inj dim } {}_R R \leq 1$ if and only if every $M \in \text{mod } R^{\text{op}}$ with $\text{Ext}_R^1(M, R) = 0$ is torsionless. Compare this with the following

PROPOSITION 4. *Let R be a left and right noetherian ring. Then the following statements are equivalent.*

- (1) $\text{proj dim } X \leq 1$ for every $X \in \text{mod } R$ with $\text{proj dim } X < \infty$.
- (2) $M^* \neq 0$ for every nonzero $M \in \text{mod } R^{\text{op}}$ with $\text{Ext}_R^1(M, R) = 0$.

PROOF. (1) \Rightarrow (2). Let $M \in \text{mod } R^{\text{op}}$ with $\text{Ext}_R^1(M, R) = 0 = M^*$. We claim $M = 0$. Let $\cdots \rightarrow P_1 \rightarrow P_0 \rightarrow M \rightarrow 0$ be a projective resolution in $\text{mod } R^{\text{op}}$ and put $X = \text{Cok}(P_1^* \rightarrow P_0^*)$. Then we have a projective resolution $0 \rightarrow P_0^* \rightarrow P_1^* \rightarrow P_2^* \rightarrow X \rightarrow 0$ in $\text{mod } R$. Since $\text{proj dim } X < \infty$, we get $\text{proj dim } X \leq 1$. Thus, since each P_i is reflexive, $M \cong \text{Cok}(P_1^{**} \rightarrow P_0^{**}) \cong \text{Ext}_R^2(X, R) = 0$.

(2) \Rightarrow (1). Suppose to the contrary that there is a torsionless $X \in \text{mod } R$ with

$\text{proj dim } X=1$. Let $0 \rightarrow P_1 \rightarrow P_0 \rightarrow X \rightarrow 0$ be a projective resolution in $\text{mod } R$ and put $M = \text{Cok}(P_0^* \rightarrow P_1^*)$. Note that $M \neq 0$. By Auslander [1, Proposition 6.3] $\text{Ext}_R^1(M, R) \cong \text{Ker } \varepsilon_X = 0$. On the other hand, since each P_i is reflexive, $M^* \cong \text{Ker}(P_1 \rightarrow P_0) = 0$, a contradiction.

PROPOSITION 5. *Let R be a left and right noetherian ring with $\text{inj dim } R_R \leq 2$. Suppose there is an integer $m \geq 1$ such that $\text{Ext}_R^m(-, R)^*$ vanishes on $\text{mod } R$. Then the following statements are equivalent.*

- (1) $\text{inj dim } R_R < \infty$.
- (2) *There is an integer $n \geq 0$ such that $\text{proj dim } X \leq n$ for every $X \in \text{mod } R$ with $\text{proj dim } X < \infty$.*
- (3) *For an $M \in \text{mod } R^{\text{op}}$, $\text{Ext}_R^i(M, R) = 0$ for all $i \geq 0$ implies $M = 0$.*

PROOF. (1) \Rightarrow (2). See Bass [2, Proposition 4.3].

(2) \Rightarrow (3). Let $M \in \text{mod } R^{\text{op}}$ with $\text{Ext}_R^i(M, R) = 0$ for all $i \geq 0$. Then by the same argument as in the proof of (1) \Rightarrow (2) in Proposition 4 it follows that $M = 0$.

(3) \Rightarrow (1). Let $M \in \text{mod } R^{\text{op}}$ with $\text{Ext}_R^i(M, R) = 0$ for all $i \geq 1$. We claim that M is reflexive. We show first that such an M is torsionless. Let $\dots \rightarrow P_1 \rightarrow P_0 \rightarrow M \rightarrow 0$ be a projective resolution in $\text{mod } R^{\text{op}}$ and put $X = \text{Cok}(P_{m-1}^* \rightarrow P_m^*)$. Then we have an exact sequence $P_0^* \rightarrow \dots \rightarrow P_m^* \rightarrow X \rightarrow 0$ in $\text{mod } R$ with the P_i^* projective. Since $M \cong \text{Cok}(P_1^* \rightarrow P_0^*)$, as in Step 2 of Section 1, $\text{Ker } \varepsilon_M \cong \text{Ext}_R^m(X, R)$. Thus $(\text{Ker } \varepsilon_M)^* = 0$. Also, since $\text{Im } \varepsilon_M$ is torsionless, the exact sequence $0 \rightarrow \text{Ker } \varepsilon_M \rightarrow M \rightarrow \text{Im } \varepsilon_M \rightarrow 0$ yields $\text{Ext}_R^i(\text{Ker } \varepsilon_M, R) \cong \text{Ext}_R^{i+1}(\text{Im } \varepsilon_M, R) = 0$ for all $i \geq 1$. Thus $\text{Ker } \varepsilon_M = 0$. Next, let $\alpha: P \rightarrow M^*$ be epic in $\text{mod } R$ with P projective. Put $\beta = \alpha^* \circ \varepsilon_M: M \rightarrow P^*$ and $N = \text{Cok } \beta$. Then β is monic and β^* is epic. Thus the exact sequence $0 \rightarrow M \rightarrow P^* \rightarrow N \rightarrow 0$ yields $\text{Ext}_R^i(N, R) = 0$ for all $i \geq 1$. Hence $\text{Ker } \varepsilon_N = 0$. Since P^* is reflexive, the exact sequence just above yields also that $\text{Cok } \varepsilon_M \cong \text{Ker } \varepsilon_N$. Therefore M is reflexive and by Hoshino [6, Proposition 2.2] the assertion follows.

According to Bass [2, Proposition 4.3], a result of Jensen [9, Proposition 6] would imply the following

PROPOSITION 6. *Let R be a left noetherian ring with $\text{inj dim } R_R = m < \infty$. Then $\text{proj dim } X \leq m$ for every left R -module X with $\text{weak dim } X < \infty$.*

PROOF. Let X be a left R -module with $\text{weak dim } X < \infty$. According to Bass [2, Proposition 4.3], we have only to prove that $\text{proj dim } X < \infty$. Let

$$\dots \longrightarrow F_1 \longrightarrow F_0 \longrightarrow X \longrightarrow 0$$

be a free resolution of X and put $X_i = \text{Cok}(F_{i+1} \rightarrow F_i)$ for $i \geq 1$. Let $n = \max\{m+1, \text{weak dim } X\}$. We claim that X_n is projective. It suffices to show that $\text{Ext}_R^k(X, X_n) = 0$. Note that X_n is flat. Let $\cdots \rightarrow P_1 \rightarrow P_0 \rightarrow Y \rightarrow 0$ be an exact sequence in $\text{mod } R$ with the P_i projective. Since $\text{Hom}_R(P_i, R) \otimes_R X_n \simeq \text{Hom}_R(P_i, X_n)$ for all $i \geq 0$, and since the functor $-\otimes_R X_n$ is exact, it follows that $\text{Ext}_R^i(Y, R) \otimes_R X_n \simeq \text{Ext}_R^i(Y, X_n)$ for all $i \geq 0$. Thus $\text{inj dim } X_n \leq \text{inj dim } R = m < n$ and $\text{Ext}_R^k(X, X_n) = 0$.
