Using the concept of common \((E.A)\) property, we prove a common fixed point theorem for three pairs of weakly compatible self-maps satisfying a new contractive condition in the framework of a generalized metric space. Our results do not rely on any commuting or continuity condition of mappings. An example is provided to support our result. The results obtained in this paper differ from the recent relative results in the literature.

1. Introduction

The study of fixed points and common fixed points of mappings satisfying certain contractive conditions has been at the center of rigorous research activity. In 2006, Mustafa and Sims [1] introduced the concept of generalized metric spaces or simply \(G\)-metric spaces as a generalization of the notion of a metric space. Based on the notion of generalized metric spaces, Mustafa et al. [2–5], Obiedat and Mustafa [6], Aydi et al. [7, 8], Gajić and Stojaković [9], and Zhou and Gu [10] obtained some fixed point results for mappings satisfying different contractive conditions. Shatanawi [11] obtained some fixed point results for \(Φ\)-maps in \(G\)-metric spaces. Chugh et al. [12] obtained some fixed point results for maps satisfying property \(P\) in \(G\)-metric spaces. Study of common fixed point problems in \(G\)-metric spaces was initiated by Abbas and Rhoades [13]. Subsequently, many authors obtained many common fixed point theorems for the mappings satisfying different contractive conditions (see [14–32] for more details). Recently, Abbas et al. [33] and Mustafa et al. [34] obtained some common fixed point results for a pair of mappings satisfying \((E.A)\) property under certain generalized strict contractive conditions in \(G\)-metric spaces. Long et al. [35] obtained some common coincidence and common fixed points results of two pairs of mappings when only one pair satisfies \((E.A)\) property in the framework of a generalized metric space.

The aim of this paper is to study common fixed point of three pairs of mappings for which only two pairs need to satisfy common \((E.A)\) property in the framework of \(G\)-metric spaces. Our results do not rely on any commuting or continuity condition of mappings.

2. Definitions and Preliminary Results

In this section, we present the necessary definitions and results in \(G\)-metric spaces.

Definition 1 (see [1]). Let \(X\) be a nonempty set, and let \(G : X \times X \times X \to R^+\) be a function satisfying the following axioms:

\begin{enumerate}
    \item[(G1)] \(G(x, y, z) = 0\) if \(x = y = z\);
    \item[(G2)] \(0 < G(x, x, y)\), for all \(x, y \in X\) with \(x \neq y\);
    \item[(G3)] \(G(x, x, y) \leq G(x, y, z)\), for all \(x, y, z \in X\) with \(z \neq y\);
    \item[(G4)] \(G(x, y, z) = G(x, z, y) = G(y, z, x) = \cdots\) (symmetry in all three variables);
    \item[(G5)] \(G(x, y, z) \leq G(x, a, a) + G(a, y, z)\) for all \(x, y, z, a \in X\) (rectangle inequality).
\end{enumerate}

Then the function \(G\) is called a generalized metric, or more specifically a \(G\)-metric on \(X\) and the pair \((X, G)\) are called a \(G\)-metric space.
It is known that the function $G(x, y, z)$ on $G$-metric space $X$ is jointly continuous in all three of its variables, and $G(x, y, z) = 0$ if and only if $x = y = z$ (see [1] for more details and the reference therein).

**Definition 2** (see [1]). Let $(X, G)$ be a $G$-metric space, and let $\{x_n\}$ be a sequence of points in $X$; a point $x$ in $X$ is said to be the limit of the sequence $\{x_n\}$ if $\lim_{n \to \infty} G(x, x_n, x_m) = 0$, and one says that sequence $\{x_n\}$ is $G$-convergent to $x$.

Thus, if $x_n \to x$ in a $G$-metric space $(X, G)$, then for any $\varepsilon > 0$ there exists $N \in \mathbb{N}$ (throughout this paper we mean by $\mathbb{N}$ the set of all natural numbers) such that $G(x, x_n, x_m) < \varepsilon$, for all $n, m \geq N$.

**Proposition 3** (see [1]). Let $(X, G)$ be a $G$-metric space; then the followings are equivalent:

1. $\{x_n\}$ is $G$-convergent to $x$.
2. $G(x_n, x_n, x) \to 0$ as $n \to \infty$.
3. $G(x_n, x_l, x) \to 0$ as $n \to \infty$.
4. $G(x_n, x_m, x) \to 0$ as $n, m \to \infty$.

**Definition 4** (see [1]). Let $(X, G)$ be a $G$-metric space. A sequence $\{x_n\}$ is called $G$-Cauchy sequence if, for each $\varepsilon > 0$, there exists $N \in \mathbb{N}$ such that $G(x_n, x_m, x_l) < \varepsilon$ for all $n, m, l \geq N$, that is, if $G(x_n, x_m, x_l) \to 0$ as $n, m, l \to \infty$.

**Definition 5** (see [1]). A $G$-metric space $(X, G)$ is said to be $G$-complete (or a complete $G$-metric space) if every $G$-Cauchy sequence $(X, G)$ is $G$-convergent in $X$.

**Proposition 6** (see [1]). Let $(X, G)$ be a $G$-metric space. Then the following are equivalent:

1. The sequence $\{x_n\}$ is $G$-Cauchy.
2. For every $\varepsilon > 0$, there exists $k \in \mathbb{N}$ such that $G(x_n, x_m, x_l) < \varepsilon$, for all $n, m \geq k$.

**Proposition 7** (see [1]). Let $(X, G)$ be a $G$-metric space. Then the function $G(x, y, z)$ is jointly continuous in all three of its variables.

**Definition 8** (see [36]). Let $f$ and $g$ be self-maps of a set $X$. If $w = fx = gx$ for some $x$ in $X$, then $x$ is called a coincidence point of $f$ and $g$, and $w$ is called a point of coincidence of $f$ and $g$.

**Definition 9** (see [36]). Two self-mappings $f$ and $g$ on $X$ are said to be weakly compatible if they commute at coincidence points.

**Definition 10** (see [33]). Let $X$ be a $G$-metric space. Self-maps $f$ and $g$ on $X$ are said to satisfy the $G(\varepsilon, A)$ property if there exists a sequence $\{x_n\}$ in $X$ such that $\{fx_n\}$ and $\{gx_n\}$ are $G$-convergent to some $t \in X$.

**Definition 11**. Let $(X, d)$ be a $G$-metric space and $A, B, S, T$ four self-maps on $X$. The pairs $(A, S)$ and $(B, T)$ are said to satisfy common $(E, A)$ property if there exist two sequences $\{x_n\}$ and $\{y_n\}$ in $X$ such that $\lim_{n \to \infty} Ax_n = \lim_{n \to \infty} Sx_n = \lim_{n \to \infty} By_n = \lim_{n \to \infty} Ty_n = t$, for some $t \in X$.

**Definition 12** (see [17]). Self-mappings $f$ and $g$ of a $G$-metric space $(X, G)$ are said to be compatible if $\lim_{n \to \infty} G(fg(x_n), fg(x_n), fg(x_n)) = 0$ and $\lim_{n \to \infty} G(fg(x_n), fg(x_n), fg(x_n)) = 0$, whenever $\{x_n\}$ is a sequence in $X$ such that $\lim_{n \to \infty} fx_n = \lim_{n \to \infty} gx_n = t$, for some $t \in X$.

**Definition 13** (see [16]). A pair of self-mappings $(f, g)$ of a $G$-metric space is said to be weakly commuting if

$$G(fgx, gfx, gfx) \leq G(fx, gx, gx), \quad \forall x \in X.$$  

**Definition 14** (see [16]). A pair of self-mappings $(f, g)$ of a $G$-metric space is said to be $R$-weakly commuting, if there exists some positive real number $R$ such that

$$G(fgx, gfx, gfx) \leq RG(fx, gx, gx), \quad \forall x \in X.$$  

### 3. Main Results

In this section, we obtain some unique common fixed point results for six mappings satisfying certain generalized contractive conditions in the framework of a generalized metric space. We start with the following result.

**Theorem 15**. Let $(X, G)$ be a $G$-metric space. Suppose mappings $f, g, h, R, S,$ and $T : X \to X$ satisfying the following conditions:

1. $G(fx, gy, hz) \leq \phi \left( \max \left\{ G(Rx, Sy, Tz), G(fx, Rx, Rx), G(gy, Sy, Sy), G(hz, Tz, Tz), \frac{1}{3} G(fx, Sy, Tz) + G(Rx, gy, Tz) \right\} \right)$
2. $G(fx, gy, Tz) + G(fx, Sy, hz) + G(Rx, gy, hz) \leq G(fx, gy, hz)$

for all $x, y, z \in X$, where $\phi : [0, \infty) \to [0, \infty)$ is the function satisfying $0 < \phi(t) < t$, for all $t > 0$. If one of the following conditions is satisfied, then the pairs $(f, R)$, $(g, S)$, and $(h, T)$ have a common point of coincidence in $X$:

(i) the subspace $RX \subseteq SX$, $GX \subseteq TX$, and two pairs of $(f, R)$ and $(g, S)$ satisfy common $(E, A)$ property;

(ii) the subspace $SX \subseteq TX$, $HX \subseteq RX$, and two pairs of $(g, S)$ and $(h, T)$ satisfy common $(E, A)$ property;

(iii) the subspace $TX \subseteq SX$, $HX \subseteq RX$, and two pairs of $(f, R)$ and $(h, T)$ satisfy common $(E, A)$ property.
Moreover, if the pairs $(f, R), (g, S),$ and $(h, T)$ are weakly compatible, then $f, g, h, R, S,$ and $T$ have a unique common fixed point in $X$.

**Proof.** First, we suppose that the subspace $RX$ is closed in $X$, $fx \subseteq SX$, $gx \subseteq TX$, and two pairs of $(f, R)$ and $(g, S)$ satisfy common (E.A) property. Then by Definition 11 we know that, there exist two sequences $\{x_n\}$ and $\{y_n\}$ in $X$ such that
\[
\lim_{n \to \infty} f x_n = \lim_{n \to \infty} R x_n = \lim_{n \to \infty} g y_n = \lim_{n \to \infty} S y_n = t
\]
for some $t \in X$.

Since $gX \subseteq TX$, there exists a sequence $\{z_n\}$ in $X$ such that $g y_n = T z_n$. Hence $\lim_{n \to \infty} T z_n = t$. Next, we will show $\lim_{n \to \infty} h z_n = t$. In fact, if $\lim_{n \to \infty} h z_n \neq t$, then from condition (3), we can get
\[
G (f x_n, g y_n, h z_n) 
\]
\[
\leq \phi \left( \max \left\{ G (R x_n, S y_n, T z_n), G (f x_n, R x_n, R x_n), G (g y_n, S y_n, S y_n), G (h z_n, T z_n, T z_n), \frac{1}{3} [G (f x_n, S y_n, T z_n) + G (R x_n, g y_n, T z_n) + G (R x_n, S y_n, h z_n)], \frac{1}{3} [G (f x_n, g y_n, T z_n) + G (f x_n, S y_n, h z_n) + G (R x_n, g y_n, h z_n)] \right\} \right).
\]
On letting $n \to \infty$ and based on the property of $\phi$, we can obtain
\[
G (t, t, \lim_{n \to \infty} h z_n) \leq \phi \left( G (\lim_{n \to \infty} h z_n, t, t) \right) < G (\lim_{n \to \infty} h z_n, t, t).
\]
It is contradiction; so $\lim_{n \to \infty} h z_n = t$.

Since $RX$ is a closed subspace of $X$ and $\lim_{n \to \infty} R x_n = t$, there exists a $p$ in $X$ such that $t = R p$. We claim that $f p = t$. Suppose not; then by using (3) we obtain
\[
G (f p, g y_n, h z_n) 
\]
\[
\leq \phi \left( \max \left\{ G (R p, S y_n, T z_n), G (f p, R p, R p), G (g y_n, S y_n, S y_n), G (h z_n, T z_n, T z_n), \frac{1}{3} [G (f p, S y_n, T z_n) + G (R p, g y_n, T z_n) + G (R p, S y_n, h z_n)], \frac{1}{3} [G (f p, g y_n, T z_n) + G (f p, S y_n, h z_n) + G (R p, g y_n, h z_n)] \right\} \right).
\]
Taking $n \to \infty$ on the two sides of the above inequality and using the property of $\phi$, we can get
\[
G (f p, t, t) \leq \phi \left( \max \left\{ G (f p, f p, t, t) \right\} \right) < G (f p, t, t).
\]
Which is contradiction, and so $f p = t = R p$. Hence, $p$ is the coincidence point of pair $(f, R)$.

By the condition $f X \subseteq SX$ and $f p = t$, there exists a point $u$ in $X$ such that $t = S u$. Now, we claim that $g u = t$. In fact, if $g u \neq t$, then from (3) we have
\[
G (f p, g u, [h, T])
\]
\[
\leq \phi \left( \max \left\{ G (R p, S u, T z_n), G (f p, R p, R p), G (g u, S u, S u), G (h z_n, T z_n, T z_n), \frac{1}{3} [G (f p, S u, T z_n) + G (R p, g u, T z_n) + G (R p, S u, h z_n)] \right\} \right).
\]
Letting $n \to \infty$ on the two sides of the above inequality and using the property of $\phi$, we can obtain
\[
G (t, g u, t) \leq \phi \left( G (g u, t, t) \right) < G (g u, t, t).
\]
It is contradiction. Hence $g u = t = S t$, and so $u$ is the coincidence point of pair $(g, S)$.

Since $gX \subseteq TX$ and $g u = t$, there exists a point $v$ in $X$ such that $t = T v$. We claim that $h v = t$. If not, from (3) and the property of $\phi$, we have
\[
G (t, t, h v) = G (f p, g u, h v) \leq \phi \left( \max \left\{ G (R p, S u, T v), G (f p, R p, R p), G (g u, S u, S u), G (h v, T v, T v), \frac{1}{3} [G (f p, S u, T v) + G (R p, g u, T v) + G (R p, S u, h v)], \frac{1}{3} [G (f p, g u, T v) + G (f p, S u, h v) + G (R p, g u, h v)] \right\} \right.
\]
\[
= \phi (G (h v, t, t)) < G (h v, t, t).
\]
It is contradiction. Hence $h v = t = T v$, and so $v$ is the coincidence point of pair $(h, T)$. 

\[\]
Therefore, in all the above cases, we obtain $f_p = R_p = \text{gu} = Su = hv = T_v = t$. Now, weakly compatibility of the pairs $(f, R)$, $(g, S)$, and $(h, T)$ gives that $ft = Rt = gt = St$, and $ht = Tt$.

Next, we show that $ft = t$. In fact, if $ft \neq t$, then from (3) we have

$$G(ft, t, t) = G(ft, gu, hv) \leq \phi \left( \max \left\{ G(Rt, Su, Tv), G(ft, Rt, Rt), \right. \right.$$  

$$+ G(Rt, Su, hv), \left. \frac{1}{3} \left[ G(ft, Sv, Tv) + G(Rt, gu, Tv) + G(Rt, Su, hv) \right] \right)$$

$$= \phi \left( G(ft, t, t) \right) < G(ft, t, t),$$

which is a contradiction; hence $ft = t$, and so $ft = Rt = t$. Similarly, it can be shown that $gt = St = t$ and $ht = Tt = t$, which means that $t$ is a common fixed point of $f, g, h, R, S, \text{and} T$.

Next, we will show the common fixed point of $f, g, h, R, S, \text{and} T$ is unique. Actually, suppose that $w \in X; w \neq t$ is another common fixed point of $f, g, h, R, S, \text{and} T$; then by condition (3) we have

$$G(w, t, t) = G(fw, gt, ht) \leq \phi \left( \max \left\{ G(Rw, St, Tt), G(fw, Rw, Rw), \right. \right.$$  

$$G(gt, St, Tt), G(ht, Tt, Tt), \left. \frac{1}{3} \left[ G(fw, St, Tt) + G(Rw, gt, Tt) + G(Rw, St, ht) \right] \right)$$

$$= \phi \left( G(w, t, t) \right) < G(w, t, t).$$

It is a contradiction, unless $w = t$; that is, mappings $f, g, h, R, S, \text{and} T$ have a unique common fixed point.

Finally, if condition (ii) or (iii) holds, then the argument is similar to that above; so we delete it.

This completes the proof of Theorem 15.

Now, we give an example to support Theorem 15.

**Example 16.** Let $X = [0, 1]$ be a $G$-metric space with

$$G(x, y, z) = |x - y| + |y - z| + |z - x|.$$  

We define mappings $f, g, h, R, S, \text{and} T$ on $X$ by

$$fx = \begin{cases} 1, & x \in [0, \frac{1}{2}] \\ \frac{5}{6}, & x \in \left(\frac{1}{2}, 1\right] \end{cases}, \quad gx = \begin{cases} 7, & x \in [0, \frac{1}{2}] \\ \frac{5}{6}, & x \in \left(\frac{1}{2}, 1\right], \quad \frac{1}{8}, & x = 1 \end{cases},$$

$$hx = \begin{cases} 6, & x \in [0, \frac{1}{2}] \\ \frac{5}{6}, & x \in \left(\frac{1}{2}, 1\right], \quad \frac{1}{2}, & x = 1 \end{cases}, \quad Rx = \begin{cases} \frac{4}{5}, & x \in [0, \frac{1}{2}] \\ \frac{5}{6}, & x \in \left(\frac{1}{2}, 1\right], \quad \frac{1}{8}, & x = 1 \end{cases},$$

$$Sx = \begin{cases} \frac{5}{6}, & x \in \left(\frac{1}{2}, 1\right], \quad \frac{1}{2}, & x = 1 \end{cases}, \quad Tx = \begin{cases} 1, & x \in [0, \frac{1}{2}] \\ \frac{5}{6}, & x \in \left(\frac{1}{2}, 1\right], \quad \frac{1}{8}, & x = 1 \end{cases}.$$  

Note that $f, g, h, R, S, \text{and} T$ are discontinuous mappings. Clearly, the subspace $RX$ is closed in $X$, $fX \subseteq SX, gX \subseteq TX, hX \subseteq RX$, and the pairs $(f, R)$, $(g, S)$, and $(h, T)$ are weakly compatible. Also, the pairs $(f, R)$ and $(g, S)$ satisfy common $(E.A)$ property; indeed, $x_n = 4/5$ and $y_n = 3/4$ for each $n \in N$ are the required sequences. The control function $\phi : [0, \infty) \to [0, \infty)$ is defined by $\phi(t) = 11t/12$.

First, we let

$$M(x, y, z) = \max \left\{ G(Rx, Sy, Tz), G(fx, Rx, Rx), G(gy, Sy, Sy), G(hz, Tz, Tz), \right.$$  

$$\frac{1}{3} \left[ G(fx, Sy, Tz) + G(Rx, gy, Tz) + G(Rx, Sy, hz) \right], \frac{1}{3} \left[ G(fx, gy, Tz) + G(fx, Sy, hz) + G(Rx, gy, hz) \right] \right\}.$$  

To prove (3), let us discuss the following cases.

**Case 1.** For $x, y, \text{and} z \in ((1/2), 1]$, then we have $G(fx, gy, hz) = 0$, and hence (3) is obviously satisfied.
Case 2. For \(x, y,\) and \(z \in [0, (1/2)]\), then we have

\[
G(\phi x, \phi y, \phi z) = G\left(1, \frac{7}{8}, \frac{6}{7}\right) = \frac{2}{7},
\]

\[
\phi(\max\{G\left(\frac{4}{5}, 1, \frac{7}{8}\right), G\left(\frac{4}{5}, \frac{4}{5}, \frac{7}{8}\right), G\left(\frac{4}{5}, \frac{7}{8}, 1\right)\})
\]

\[
\frac{1}{3}\left[G\left(\frac{4}{5}, \frac{7}{8}, \frac{6}{7}\right) + G\left(\frac{4}{5}, \frac{7}{8}, 1\right) + G\left(\frac{4}{5}, \frac{7}{8}, \frac{6}{7}\right)\right]
\]

\[
= \phi\left(\max\left\{\frac{2}{5}, \frac{2}{5}, \frac{1}{4}, \frac{4}{15}, \frac{8}{35}\right\}\right)
\]

\[
= \phi\left(\frac{2}{5}\right) = \frac{11}{30}.
\]

Therefore,

\[
G(\phi x, \phi y, \phi z) < \frac{11}{30} = \phi(\max\{G\left(\frac{4}{5}, 1, \frac{7}{8}\right), G\left(\frac{4}{5}, \frac{4}{5}, \frac{7}{8}\right), G\left(\frac{4}{5}, \frac{7}{8}, 1\right)\}) = \phi(\max\{G\left(\frac{4}{5}, \frac{7}{8}, \frac{6}{7}\right) + G\left(\frac{4}{5}, \frac{7}{8}, 1\right) + G\left(\frac{4}{5}, \frac{7}{8}, \frac{6}{7}\right)\}) = \phi\left(\frac{2}{5}\right) = \frac{11}{30}.
\]

(17)

(b) If \(z = 1\), then we get

\[
\phi(\max\{G\left(\frac{4}{5}, 1, \frac{7}{8}\right), G\left(\frac{4}{5}, \frac{4}{5}, \frac{7}{8}\right), G\left(\frac{4}{5}, \frac{7}{8}, 1\right)\}) = \phi\left(\frac{2}{5}\right) = \frac{11}{30}.
\]

Hence, we can get

\[
G(\phi x, \phi y, \phi z) < \frac{11}{30} = \phi(\max\{G\left(\frac{4}{5}, 1, \frac{7}{8}\right), G\left(\frac{4}{5}, \frac{4}{5}, \frac{7}{8}\right), G\left(\frac{4}{5}, \frac{7}{8}, 1\right)\}) = \phi(\max\{G\left(\frac{4}{5}, \frac{7}{8}, \frac{6}{7}\right) + G\left(\frac{4}{5}, \frac{7}{8}, 1\right) + G\left(\frac{4}{5}, \frac{7}{8}, \frac{6}{7}\right)\}) = \phi\left(\frac{2}{5}\right) = \frac{11}{30}.
\]

(18)

Case 3. For \(x, y \in [0, (1/2)], z \in ((1/2), 1]\), then we have

\[
G(\phi x, \phi y, \phi z) = G\left(1, \frac{7}{8}, \frac{5}{6}\right) = \frac{1}{3}.
\]

(19)

Next we divide the study in two subcases.

(a) If \(z \in ((1/2), 1]\), then we obtain

\[
\phi(\max\{G\left(\frac{4}{5}, \frac{5}{6}, 1\right), G\left(\frac{4}{5}, \frac{5}{6}, \frac{5}{6}\right), G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right)+G\left(\frac{6}{7}, \frac{7}{11}, \frac{11}{45}\right)\})
\]

\[
= \phi\left(\frac{2}{5}\right) = \frac{11}{30}.
\]

(20)

Thus we have

\[
G(\phi x, \phi y, \phi z) < \frac{11}{30} = \phi(\max\{G\left(\frac{4}{5}, \frac{5}{6}, 1\right), G\left(\frac{4}{5}, \frac{5}{6}, \frac{5}{6}\right), G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right)+G\left(\frac{6}{7}, \frac{7}{11}, \frac{11}{45}\right)\}) = \phi\left(\frac{2}{5}\right) = \frac{11}{30}.
\]

(21)

Case 4. For \(x, z \in [0, (1/2)], y \in ((1/2), 1]\), then we have

\[
G(\phi x, \phi y, \phi z) = G\left(1, \frac{5}{6}, \frac{6}{7}\right) = \frac{1}{3}.
\]

(22)

Next we divide the study in two subcases.

(a) If \(y \in ((1/2), 1]\), then we obtain

\[
\phi(\max\{G\left(\frac{4}{5}, \frac{5}{6}, 1\right), G\left(\frac{4}{5}, \frac{5}{6}, \frac{5}{6}\right), G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right)+G\left(\frac{6}{7}, \frac{7}{11}, \frac{11}{45}\right)\})
\]

\[
= \phi\left(\frac{2}{5}\right) = \frac{11}{30}.
\]

(23)

Thus we have

\[
G(\phi x, \phi y, \phi z) < \frac{11}{30} = \phi(\max\{G\left(\frac{4}{5}, \frac{5}{6}, 1\right), G\left(\frac{4}{5}, \frac{5}{6}, \frac{5}{6}\right), G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right)+G\left(\frac{6}{7}, \frac{7}{11}, \frac{11}{45}\right)\}) = \phi\left(\frac{2}{5}\right) = \frac{11}{30}.
\]

(24)
(b) If $y = 1$, then we can get

$$
\phi(M(x, y, z)) = \phi\left(\max\left\{G\left(\frac{4}{5}, 0, 1\right), G\left(1, \frac{4}{5}, \frac{5}{6}\right), G\left(\frac{5}{6}, 0, 0\right), \right.\right.
$$

$$
G\left(\frac{6}{7}, 1, 1\right), \frac{1}{3} [G(1, 0, 1) + G\left(\frac{4}{5}, \frac{5}{6}, 1\right) + G\left(\frac{4}{5}, 0, \frac{6}{7}\right)]
$$

$$
\left.\left. + G\left(\frac{5}{6}, 0, \frac{6}{7}\right)\right] \right\}
$$

$$
\left.\left. + G\left(\frac{4}{5}, \frac{5}{6}, \frac{6}{7}\right)\right]\right)\right).
$$

$$
\phi\left(\max\{2, \frac{5}{3}, \frac{2}{7}, \frac{142}{105}, \frac{77}{315}\}\right)
$$

$$
= \phi\left(\max\{\frac{11}{6}\}\right)
$$

$$
= \phi\left(\frac{2}{5}\right) = \frac{11}{36}.
$$

(26)

So, we have

$$
G(fx, gy, hz) = \frac{1}{3} < \frac{11}{6} = \phi(M(x, y, z)).
$$

(27)

Case 5. For $x \in ((1/2), 1]$, $y, z \in [0, (1/2)]$, then we have

$$
G(fx, gy, hz) = G\left(\frac{5}{6}, \frac{7}{8}, \frac{6}{7}\right) = \frac{1}{12}.
$$

(28)

Next we divide the study into two subcases.

(a) If $x \in ((1/2), 1)$, then we can get

$$
\phi(M(x, y, z)) = \phi\left(\max\left\{G\left(\frac{5}{6}, 1, 1\right), G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right), G\left(\frac{5}{6}, 1, 1\right),
$$

$$
G\left(\frac{6}{7}, 1, 1\right), \frac{1}{3} [G\left(\frac{5}{6}, 1, 1\right) + G\left(\frac{5}{6}, \frac{7}{8}, 1\right) + G\left(\frac{5}{6}, \frac{6}{7}, 1\right)],
$$

$$
\frac{1}{3} [G\left(\frac{5}{6}, \frac{7}{8}, 1\right) + G\left(\frac{5}{6}, 1, 1\right) + G\left(\frac{5}{6}, \frac{7}{8}, 1\right)]\right)\right)
$$

$$
= \phi\left(\max\left\{\frac{1}{3}, 0, \frac{1}{3}, \frac{1}{3}\right\}\right)
$$

$$
= \phi\left(\frac{1}{3}\right) = \frac{11}{36}.
$$

(29)

Thus we have

$$
G(fx, gy, hz) = \frac{1}{12} < \frac{11}{36} = \phi(M(x, y, z)).
$$

(30)

(b) If $x = 1$, then we obtain

$$
\phi(M(x, y, z)) = \phi\left(\max\left\{G\left(\frac{6}{7}, 1, 1\right), G\left(\frac{5}{6}, \frac{6}{7}, \frac{6}{7}\right), G\left(\frac{7}{8}, 1, 1\right),
$$

$$
G\left(\frac{6}{7}, 1, 1\right), \frac{1}{3} [G\left(\frac{5}{6}, 1, 1\right) + G\left(\frac{6}{7}, \frac{7}{8}, 1\right) + G\left(\frac{6}{7}, \frac{6}{7}, 1\right)],
$$

$$
\frac{1}{3} [G\left(\frac{5}{6}, \frac{7}{8}, 1\right) + G\left(\frac{5}{6}, 1, 1\right) + G\left(\frac{6}{7}, \frac{7}{8}, 1\right)]\right)\right)
$$

$$
= \phi\left(\max\left\{\frac{2}{7}, \frac{1}{4}, \frac{2}{7}, \frac{19}{63}, \frac{59}{252}\right\}\right)
$$

$$
= \phi\left(\frac{19}{63}\right) = \frac{209}{756}.
$$

(31)

Hence we get

$$
G(fx, gy, hz) = \frac{1}{12} < \frac{209}{756} = \phi(M(x, y, z)).
$$

(32)

Case 6. For $x \in [0, (1/2)]$, $y \in ((1/2), 1)$, and $z \in ((1/2), 1)$, then we have

$$
G(fx, gy, hz) = G\left(\frac{1}{3}, \frac{5}{6}, \frac{5}{6}\right) = \frac{1}{3}.
$$

(33)

Next we divide the study into four subcases.

(a) If $y \in ((1/2), 1)$ and $z \in ((1/2), 1)$, then we have

$$
\phi(M(x, y, z)) = \phi\left(\max\left\{G\left(\frac{4}{5}, \frac{5}{6}, \frac{5}{6}\right), G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right), G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right), \frac{1}{3} [G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right) + G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right) + G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right)]\right)\right)
$$

$$
= \phi\left(\max\left\{\frac{1}{3}, 0, \frac{1}{3}, \frac{1}{3}\right\}\right)
$$

$$
= \phi\left(\frac{1}{3}\right) = \frac{11}{30}.
$$

(34)

Thus we have

$$
G(fx, gy, hz) = \frac{1}{3} < \frac{11}{30} = \phi(M(x, y, z)).
$$

(35)
(b) If \( y = 1 \) and \( z \in ((1/2), 1) \), then we have

\[
\phi(M(x, y, z)) = \phi(\max \{G\left(\frac{4}{5}, 0, \frac{5}{6}\right), G\left(1, \frac{4}{5}, \frac{4}{5}\right), G\left(\frac{5}{6}, 0, 0\right)\},
\]
\[
G\left(\frac{5}{6}, 0, \frac{5}{6}\right), \frac{1}{3} G\left(1, 0, \frac{5}{6}\right) + G\left(\frac{4}{5}, \frac{5}{6}, \frac{5}{6}\right),
\]
\[
+G\left(\frac{4}{5}, 0, \frac{5}{6}\right), \frac{1}{3} G\left(1, 0, \frac{5}{6}\right) + G\left(\frac{4}{5}, \frac{5}{6}, \frac{5}{6}\right)
\]
\[
= \phi\left(\max \left\{\frac{5}{6}, \frac{5}{6}, 0, \frac{56}{45}, \frac{4}{5}\right\}\right)
\]
\[
= \phi\left(\frac{5}{3}\right) = \frac{55}{36}.
\]

(36)

Therefore, we can get

\[
G(fx, gy, hz) = \frac{1}{3} < \frac{55}{36} = \phi(M(x, y, z)).
\]

(37)

(c) If \( y \in ((1/2), 1) \) and \( z = 1 \), then we get

\[
\phi(M(x, y, z)) = \phi(\max \{G\left(\frac{4}{5}, 0, \frac{7}{8}\right), G\left(1, \frac{4}{5}, \frac{5}{6}\right), G\left(\frac{5}{6}, 0, 0\right)\},
\]
\[
G\left(\frac{5}{6}, 0, \frac{7}{8}\right), \frac{1}{3} \left[ G\left(1, \frac{5}{6}, 0\right) + G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right) + G\left(\frac{5}{6}, 0, \frac{5}{6}\right)\right],
\]
\[
\frac{1}{3} \left[ G\left(1, \frac{5}{6}, 0\right) + G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right) + G\left(\frac{5}{6}, 0, \frac{5}{6}\right)\right]
\]
\[
= \phi\left(\max \left\{\frac{7}{4}, \frac{5}{3}, 0, \frac{11}{45}, \frac{4}{5}\right\}\right)
\]
\[
= \phi\left(\frac{7}{4}\right) = \frac{77}{48}.
\]

(38)

Thus, we can get

\[
G(fx, gy, hz) = \frac{1}{3} < \frac{77}{48} = \phi(M(x, y, z)).
\]

(40)

(d) If \( y = 1 \) and \( z = 1 \), then we have

\[
\phi(M(x, y, z)) = \phi\left(\max \left\{G\left(\frac{4}{5}, 0, \frac{7}{8}\right), G\left(1, \frac{4}{5}, \frac{5}{6}\right), G\left(\frac{5}{6}, 0, 0\right)\},
\]
\[
G\left(\frac{5}{6}, 0, \frac{7}{8}\right), \frac{1}{3} \left[ G\left(1, \frac{5}{6}, 0\right) + G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right) + G\left(\frac{5}{6}, 0, \frac{5}{6}\right)\right],
\]
\[
\frac{1}{3} \left[ G\left(1, \frac{5}{6}, 0\right) + G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right) + G\left(\frac{5}{6}, 0, \frac{5}{6}\right)\right]
\]
\[
= \phi\left(\max \left\{\frac{3}{20}, \frac{2}{5}, 0, \frac{1}{20} \cdot \frac{11}{12}, \frac{11}{45}\right\}\right)
\]
\[
= \phi\left(\frac{2}{5}\right) = \frac{11}{30}.
\]

(39)

Therefore, we can get

\[
G(fx, gy, hz) = \frac{1}{3} < \frac{11}{30} = \phi(M(x, y, z)).
\]
Thus, we can get
\[ G(f_x, g_y, h_z) = \frac{1}{12} < \frac{11}{36} = \phi(M(x, y, z)). \] (44)

(b) If \( x = 1 \) and \( z \in ((1/2), 1) \), then we have
\[ \phi(M(x, y, z)) \]
\[ = \phi\left( \max \left\{ G\left(\frac{6}{7}, 1, \frac{7}{8}\right), G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right), G\left(\frac{5}{6}, \frac{5}{6}, \frac{7}{8}\right) \right\} \right) \]
\[ = \phi\left( \max \left\{ \frac{1}{3}, 0, \frac{1}{4}, \frac{1}{4}, \frac{1}{4}, \frac{1}{4} \right\} \right) \]
\[ = \phi\left( \frac{1}{3} \right) = \frac{11}{36}. \] (45)

Hence, we obtain
\[ G(f_x, g_y, h_z) = \frac{1}{12} < \frac{11}{36} = \phi(M(x, y, z)). \] (46)

(c) If \( x \in ((1/2), 1) \) and \( z = 1 \), then we get
\[ \phi(M(x, y, z)) \]
\[ = \phi\left( \max \left\{ G\left(\frac{5}{6}, \frac{5}{6}, 1\right), G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right), G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right), G\left(\frac{7}{8}, 1, 1\right) \right\} \right) \]
\[ = \phi\left( \max \left\{ \frac{1}{3}, 0, \frac{1}{4}, \frac{1}{4}, \frac{1}{4}, \frac{1}{4} \right\} \right) \]
\[ = \phi\left( \frac{1}{3} \right) = \frac{11}{36}. \] (47)

Therefore, we have
\[ G(f_x, g_y, h_z) = \frac{1}{12} < \frac{11}{36} = \phi(M(x, y, z)). \] (48)

(d) If \( x = 1 \) and \( z = 1 \), then we have
\[ \phi(M(x, y, z)) \]
\[ = \phi\left( \max \left\{ G\left(\frac{6}{7}, 1, \frac{7}{8}\right), G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right), G\left(\frac{7}{8}, 1, 1\right), G\left(\frac{6}{7}, \frac{7}{8}, \frac{7}{8}\right) \right\} \right) \]
\[ = \phi\left( \max \left\{ \frac{1}{3}, \frac{1}{4}, \frac{1}{4}, \frac{1}{4}, \frac{1}{4}, \frac{1}{4} \right\} \right) \]
\[ = \phi\left( \frac{1}{3} \right) = \frac{11}{36}. \] (49)

Thus, we obtain
\[ G(f_x, g_y, h_z) = \frac{1}{12} < \frac{11}{42} = \phi(M(x, y, z)). \] (50)

Case 8. For \( x \in ((1/2), 1], y \in ((1/2), 1], \) and \( z \in [0, (1/2)], \) then we have
\[ G(f_x, g_y, h_z) = G\left(\frac{5}{6}, \frac{5}{6}, \frac{7}{8}\right) = \frac{1}{21}. \] (51)

Next we divide the study in four subcases.

(a) If \( x \in ((1/2), 1) \) and \( y \in ((1/2), 1), \) then we get
\[ \phi(M(x, y, z)) \]
\[ = \phi\left( \max \left\{ G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right), G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right), G\left(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}\right) \right\} \right) \]
\[ = \phi\left( \max \left\{ \frac{1}{3}, 0, \frac{1}{4}, \frac{1}{4}, \frac{1}{4}, \frac{1}{4} \right\} \right) \]
\[ = \phi\left( \frac{1}{3} \right) = \frac{11}{36}. \] (52)

Therefore, we have
\[ G(f_x, g_y, h_z) = \frac{1}{12} < \frac{11}{36} = \phi(M(x, y, z)). \] (48)

Thus, we obtain
\[ G(f_x, g_y, h_z) = \frac{1}{21} < \frac{11}{36} = \phi(M(x, y, z)). \] (53)
(b) If \( x = 1 \) and \( y \in ((1/2), 1) \), then we have

\[
\phi(M(x, y, z)) = \phi \left( \max \left\{ G \left( \frac{5}{6}, \frac{5}{6}, 0, 1 \right), G \left( \frac{5}{6}, \frac{5}{6}, \frac{5}{6}, 0, 0 \right), G \left( \frac{5}{6}, \frac{5}{6}, 0, 1 \right) \right\} \right)
\]

Thus, we obtain

\[
G(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}, 0, 0) = \phi(2) = \frac{11}{6},
\] (54)

Thus, we obtain

\[
G(\frac{5}{6}, \frac{5}{6}, \frac{5}{6}, 1) = \frac{11}{36}\n\] (55)

(c) If \( x \in ((1/2), 1) \) and \( y = 1 \), then we obtain

\[
\phi(M(x, y, z)) = \phi \left( \max \left\{ G \left( \frac{5}{6}, \frac{5}{6}, 0, 1 \right) \right\} \right)
\]

Thus, we obtain

\[
G(\frac{5}{6}, \frac{5}{6}, 1, 1) = \frac{11}{36}\n\] (56)

(d) If \( x = 1 \) and \( y = 1 \), then we have

\[
\phi(M(x, y, z)) = \phi \left( \max \left\{ G \left( \frac{6}{7}, \frac{6}{7}, 0, 1 \right), G \left( \frac{5}{6}, \frac{5}{6}, \frac{5}{6}, 0, 0 \right), G \left( \frac{6}{7}, \frac{6}{7}, 1 \right) \right\} \right)
\]

Thus, we obtain

\[
G(\frac{6}{7}, \frac{6}{7}, 0, 1) = \frac{11}{6}\n\] (57)

Then in all the above cases, the mappings \( f, g, h, R, S, \) and \( T \) are satisfying conditions (3) and (i) of Theorem 15, so that all the conditions of Theorem 15 are satisfied. Moreover, \( 5/6 \) is the unique common fixed point of \( f, g, h, R, S, \) and \( T \).

Remark 17. In this paper, we get the new common fixed point theorem using the common \((E.A)\) property with three pairs of weakly compatible mappings. This is a new result has never been discussed by other authors.

Remark 18. If we take (1) \( R = S = T \); (2) \( f = g = h \); (3) \( R = S = T = I \) (I is identity mapping); (4) \( S = T \) and \( g = h \); (5) \( S = T, g = h = I \) in Theorem 15, then several new results can be obtained.

Corollary 19. Let \((X, G)\) be a \(G\)-metric space. Suppose mappings \( f, g, h, R, S, \) and \( T : X \to X \) satisfy the following conditions:

\[
G(\frac{5}{6}, \frac{5}{6}, 0, 1) \leq \lambda \max \left\{ G(Rx, Sy, Tz), G(Rx, Rx), G(\frac{5}{6}, \frac{5}{6}, 0, 0), G(\frac{5}{6}, \frac{5}{6}, 0, 1) \right\}
\]

Thus, we obtain

\[
G(\frac{5}{6}, \frac{5}{6}, 1, 1) = \frac{11}{36}\n\] (58)

Thus, we obtain

\[
G(\frac{5}{6}, \frac{5}{6}, 1) = \frac{11}{6}\n\] (59)

Then in all the above cases, the mappings \( f, g, h, R, S, \) and \( T \) are satisfying conditions (3) and (i) of Theorem 15, so that all the conditions of Theorem 15 are satisfied. Moreover, \( 5/6 \) is the unique common fixed point of \( f, g, h, R, S, \) and \( T \).
for all \( x, y, \) and \( z \in X \), where \( \lambda \in [0, 1) \). If one of the following conditions is satisfied, then the pairs \((f, R), (g, S), \) and \((h, T)\) have a common point of coincidence in \( X \).

(i) The subspace \( RX \) is closed in \( X \), \( fX \subseteq SX \), \( gX \subseteq TX \), and two pairs of \((f, R)\) and \((g, S)\) satisfy common \((E.A)\) property.

(ii) The subspace \( SX \) is closed in \( X \), \( gX \subseteq TX \), \( hX \subseteq RX \), and two pairs of \((g, S)\) and \((h, T)\) satisfy common \((E.A)\) property.

(iii) The subspace \( TX \) is closed in \( X \), \( fX \subseteq SX \), \( hX \subseteq RX \), and two pairs of \((f, R)\) and \((h, T)\) satisfy common \((E.A)\) property.

Moreover, if the pairs \((f, R), (g, S), \) and \((h, T)\) are weakly compatible, then \( f, g, h, R, S, \) and \( T \) have a unique common fixed point in \( X \).

**Proof.** Taking \( \phi(t) = \lambda t, \lambda \in [0, 1) \) in Theorem 15, the conclusion of Corollary 19 can be obtained from Theorem 15 immediately. This completes the proof of Corollary 19.

**Remark 20.** If we take (1) \( R = S = T \); (2) \( f = g = h \); (3) \( R = S = T = I \) (I is identity mapping); (4) \( S = T \) and \( g = h \); (5) \( S = T, g = h = 1 \) in Corollary 19, then several new results can be obtained.

**Corollary 21.** Let \((X, G)\) be a \( G \)-metric space. Suppose mappings \( f, g, h, R, S, \) and \( T : X \rightarrow X \) satisfy the following conditions:

\[
G(fx, gy, hz) \leq a_1 G(Rx, Sy, Tz) + a_2 G(fx, Rx, Rx) + a_3 g(hz, Tz) + a_4 G(Sy, Sy) + a_5 G(fx, Tz) + G(Rx, gy, Ty) + G(Rx, gy, hz) + a_6 G(fx, gy, Tz) + G(fx, Sy, hz)
\]

\[\text{for all } x, y, \text{ and } z \in X, \text{ where } a_i \geq 0 \ (i = 1, 2, 3, 4, 5, \) and \( 0 \leq a_1 + a_2 + a_3 + a_4 + 3a_5 + 3a_6 < 1. \) If one of the following conditions is satisfied, then the pairs \((f, R), (g, S), \) and \((h, T)\) have a common point of coincidence in \( X \):

(i) The subspace \( RX \) is closed in \( X \), \( fX \subseteq SX \), \( gX \subseteq TX \), and two pairs of \((f, R)\) and \((g, S)\) satisfy common \((E.A)\) property;

(ii) The subspace \( SX \) is closed in \( X \), \( gX \subseteq TX \), \( hX \subseteq RX \), and two pairs of \((g, S)\) and \((h, T)\) satisfy common \((E.A)\) property;

(iii) The subspace \( TX \) is closed in \( X \), \( fX \subseteq SX \), \( hX \subseteq RX \), and two pairs of \((f, R)\) and \((h, T)\) satisfy common \((E.A)\) property.

Moreover, if the pairs \((f, R), (g, S), \) and \((h, T)\) are weakly compatible, then \( f, g, h, R, S, \) and \( T \) have a unique common fixed point in \( X \).

**Proof.** Suppose that

\[
M(x, y, z) = \max \left\{ G(Rx, Sy, Tz), G(fx, Rx, Rx), G(gy, Sy, Sy), G(hz, Tz, Tz), \right. \]

\[
\frac{1}{3} \left[ G(fx, Sy, Tz) + G(Rx, gy, Tz) + G(Rx, hz) \right] \}

\[\text{Then}
\]

\[
a_1 G(Rx, Sy, Tz) + a_2 G(fx, Rx, Rx)
\]

\[
+ a_3 G(gy, Sy, Sy) + a_4 G(hz, Tz, Tz)
\]

\[
+ a_5 [G(fx, Sy, Tz) + G(Rx, gy, Ty) + G(Rx, Sy, hz)]
\]

\[
+ a_6 [G(fx, gy, Tz) + G(fx, Sy, hz) + G(Rx, gy, hz)] \}

\[\text{So, if condition (61) holds, then}
\]

\[
G(fx, gy, hz) \leq (a_1 + a_2 + a_3 + a_4 + 3a_5 + 3a_6) M(x, y, z).
\]
