

## 155. Note on Pure Subsystems

By Nobuaki KUROKI

College of Science and Technology, Nihon University

(Comm. by Kenjiro SHODA, M. J. A., Nov. 12, 1974)

1. By a *right S-system*  $M_S$  over a semigroup  $S$  we mean a set  $M$  together with a mapping  $(x, a) \rightarrow xa$  of  $M \times S$  into  $M$  satisfying

$$x(ab) = (xa)b$$

for all  $x \in M$  and  $a, b \in S$ . A non-empty subset  $N$  of a right  $S$ -system  $M_S$  is called an *S-subsystem* of  $M_S$  if  $NS \subseteq N$ . An  $S$ -subsystem  $N$  of a right  $S$ -system  $M_S$  is called *R-pure* in  $S$  if

$$N \cap Ma = Na$$

for all  $a \in S$ . Since the inclusion  $\supseteq$  is true for every  $S$ -subsystem  $N$  of  $M_S$ , the essential requirement is

$$N \cap Ma \subseteq Na$$

for all  $a \in S$ . A right  $S$ -system  $M_S$  is called *R\*-pure* if every  $S$ -subsystem of  $M_S$  is  $R$ -pure in  $S$ .

In [3] the author proved that for a semigroup  $S$  with an identity the following conditions are equivalent:

- (1)  $S$  is regular.
- (2) Every unital right  $S$ -system  $M_S$  is  $R^*$ -pure.
- (3)  $S$  is  $R^*$ -pure.

In this note we shall give another properties of pure  $S$ -subsystems of a right  $S$ -system  $M_S$  over a semigroup  $S$ . For the terminology not defined here we refer to the book by A. H. Clifford and G. B. Preston [1].

2. A subsemigroup  $B$  of a semigroup  $S$  is called a *bi-ideal* of  $S$  if  $BSB \subseteq B$ . We denote by  $[b]$  the principal bi-ideal of a semigroup  $S$  generated by  $b$  in  $S$ , that is,

$$[b] = b \cup b^2 \cup bSb.$$

First we give the following.

**Theorem 1.** *For an S-subsystem  $N$  of a right S-system  $M_S$  over a semigroup  $S$  the following conditions are equivalent:*

- (1)  $N$  is  $R$ -pure in  $S$ .
- (2)  $N \cap MB = NB$  for all bi-ideals  $B$  of  $S$ .
- (3)  $N \cap M[b] = N[b]$  for all  $b \in S$ .

**Proof.** First we assume that  $N$  is  $R$ -pure in  $S$ . Let  $B$  be any bi-ideal of  $S$  and  $p = qb$  ( $p \in N, q \in M, b \in B$ ) any element of  $N \cap MB$ . Then we have

$$p = qb \in N \cap Mb = Nb \subseteq NB$$

and so we have

$$N \cap MB \subseteq NB.$$

Since the converse inclusion always holds, we have

$$N \cap MB = NB$$

for all bi-ideals  $B$  of  $S$ . Therefore we obtain that (1) implies (2). It is clear that (2) implies (3). We assume that (3) holds. Let  $a$  be any element of  $S$  and  $p = qa$  ( $p \in N, q \in M$ ) any element of  $N \cap Ma$ . Then we have

$$\begin{aligned} p &= qa \in N \cap M[a] = N[a] \\ &= N(a \cup a^2 \cup aSa) \\ &= Na \cup Na^2 \cup N(aSa) \\ &= Na \cup (Na)a \cup (NaS)a \\ &\subseteq Na \cup Na \cup Na \\ &= Na \end{aligned}$$

and so we have

$$N \cap Ma \subseteq Na$$

for all  $a \in S$ . Thus we obtain that  $N$  is  $R$ -pure in  $S$  and that (3) implies (1). This completes the proof of the theorem.

A right ideal  $A$  of a semigroup  $S$  is called  $R$ -pure in  $S$  if

$$A \cap Sa = Aa$$

for all  $a \in S$ . A semigroup  $S$  is called  $R^*$ -pure if every right ideal of  $S$  is  $R$ -pure in  $S$ .

Since any right ideal of a semigroup  $S$  is an  $S$ -subsystem of a right  $S$ -system  $S_s$ , the following corollary is immediate from the above theorem.

**Corollary 2.** *For a right ideal  $A$  of a semigroup  $S$  the following conditions are equivalent:*

- (1)  $A$  is  $R$ -pure in  $S$ .
- (2)  $A \cap SB = AB$  for all bi-ideals  $B$  of  $S$ .
- (3)  $A \cap S[b] = A[b]$  for all  $b \in S$ .

We denote by  $[a]_r$  the principal right ideal of a semigroup  $S$  generated by  $a$  in  $S$ , that is,

$$[a]_r = a \cup aS.$$

**Corollary 3.** *For a semigroup  $S$  the following conditions are equivalent:*

- (1)  $S$  is  $R^*$ -pure.
- (2)  $A \cap SB = AB$  for all right ideals  $A$  and for all bi-ideals  $B$  of  $S$ .
- (3)  $A \cap S[b] = A[b]$  for all right ideals  $A$  and for all  $b \in S$ .
- (4)  $[a]_r \cap Sb = [a]_r b$  for all  $a, b \in S$ .
- (5)  $[a]_r \cap SB = [a]_r B$  for all  $a \in S$  and for all bi-ideals  $B$  of  $S$ .
- (6)  $[a]_r \cap S[b] = [a]_r [b]$  for all  $a, b \in S$ .

**Proof.** It follows from Corollary 2 that (1)~(3) are equivalent, and that (4)~(6) are equivalent. It is clear that (1) implies (4). We assume that (4) holds. Let  $A$  be any right ideal of  $S$  and  $b$  any element of  $S$ . Let  $a=sb$  ( $a \in A, s \in S$ ) be any element of  $A \cap Sb$ . Then we have

$$a=sb \in [a]_r \cap Sb = [a]_r b \subseteq Ab$$

and so we have

$$A \cap Sb \subseteq Ab$$

for all  $b \in S$ . This means that  $A$  is  $R$ -pure in  $S$ . Therefore we obtain that (4) implies (1).

3. A semigroup  $S$  is called *regular* if, for any element  $a \in S$ , there exists an element  $x$  in  $S$  such that  $a=axa$ .

The equivalence of (1) and (2) in the next theorem is due to the author ([3] Theorem 12). The rest of the proof can be easily proved.

**Theorem 4.** For an  $S$ -subsystem  $N$  of a right  $S$ -system  $M_S$  over a regular semigroup  $S$  the following conditions are equivalent:

- (1)  $N$  is  $R$ -pure in  $S$ .
- (2)  $N \cap Me = Ne$  for all idempotents  $e \in S$ .
- (3)  $N \cap M[e] = N[e]$  for all idempotents  $e \in S$ .

**Corollary 5.** For a right ideal  $A$  of a regular semigroup  $S$  the following conditions are equivalent:

- (1)  $A$  is  $R$ -pure in  $S$ .
- (2)  $A \cap Se = Ae$  for all idempotents  $e \in S$ .
- (3)  $A \cap S[e] = A[e]$  for all idempotents  $e \in S$ .

4. A right  $S$ -system  $M_S$  is called *unital* if  $S$  contains an identity  $1$  such that  $x1=x$  for all  $x \in M$ . A right  $S$ -system  $M_S$  is called *torsion free* if  $xd=yd$  with  $d$  cancellable in  $S$  implies  $x=y$ , and is called *divisible* if  $Md=M$  for every cancellable element  $d \in S$ .

**Theorem 6.** Let  $M_S$  be a divisible torsion free right  $S$ -system over a semigroup  $S$ . Then any  $R$ -pure  $S$ -subsystem  $N$  of  $M_S$  is divisible.

**Proof.** Let  $x$  be any element of  $N$ . Then, since  $M_S$  is divisible, there exists an element  $y$  in  $M$  such that  $x=yd$  for every cancellable element  $d \in S$ . Since  $N$  is  $R$ -pure in  $S$ ,

$$x=yd \in N \cap Md = Nd.$$

This implies that there exists an element  $z$  in  $N$  such that

$$yd=zd.$$

Since  $M_S$  is torsion free, we have

$$y=z \in N,$$

and so we have

$$N \subseteq Nd.$$

Since the converse inclusion always holds, we have

$$N = Nd$$

for every cancellable element  $d \in S$ . Therefore  $N$  is divisible.

**Theorem 7.** *Any  $S$ -subsystem  $N$  of a unital right  $S$ -system  $M_S$  over a group  $S$  is  $R$ -pure and divisible.*

**Proof.** For any element  $a \in S$ , we have

$$N = N1 = N(a^{-1}a) = (Na^{-1})a \subseteq Na \subseteq N,$$

and so we have

$$N = Na$$

for all  $a \in S$ . This holds for all cancellable elements  $a \in S$ . Thus  $N$  is divisible. On the other hand, we have

$$N \cap Ma = Na \cap Ma = Na$$

for all  $a \in S$ . Therefore  $N$  is  $R$ -pure in  $S$ . This completes the proof of the theorem.

5. A semigroup  $S$  is called *normal* if  $aS = Sa$  for all  $a \in S$  ([4]). Then we have the following.

**Theorem 8.** *Let  $M_S$  be a right  $S$ -system over a normal semigroup  $S$ . Then the minimal  $S$ -subsystem  $N$  of  $M_S$  is  $R$ -pure and divisible.*

**Proof.** For any element  $a$  of  $S$ , it follows that

$$Na \subseteq N.$$

Since  $S$  is normal, we have

$$(Na)S = N(aS) = N(Sa) = (NS)a \subseteq Na.$$

This means that  $Na$  is an  $S$ -subsystem of  $M_S$ . Then it follows from this and the minimality of  $N$  that

$$Na = N$$

for all  $a \in S$ . Then  $N$  is  $R$ -pure in  $S$  and divisible (see the proof of Theorem 7). This completes the proof of the theorem.

Let  $A$  be any right ideal of a normal semigroup  $S$ . Then, as is easily seen,

$$AS = SA$$

holds. Thus we have the following lemma.

**Lemma 9.** *Any one-sided ideal of a normal semigroup is two-sided.*

The following corollary is immediate from Theorem 8 and Lemma 9.

**Corollary 10.** *The minimal right (left, two-sided) ideal of a normal semigroup is a group.*

6. A semigroup  $S$  is called  *$R$ -pure-free* if it does not properly contain any  $R$ -pure right ideal. In this section we give a non-trivial class of  $R$ -pure-free semigroups.

A commutative semigroup  $S$  is called *archimedean* if, for any elements  $a$  and  $b$  of  $S$ , there exist elements  $x$  and  $y$  in  $S$  and positive integers  $m$  and  $n$  such that

$$a^m = xb \quad \text{and} \quad b^n = ya.$$

By an *N-semigroup* we mean a commutative cancellative archimedean semigroup without idempotents. Then we have the following.

**Theorem 11.** *Any N-semigroup is R-pure-free.*

**Proof.** Let  $A$  be any  $R$ -pure right ideal of an  $N$ -semigroup  $S$ , and let  $a$  and  $s$  be respectively any elements of  $A$  and  $S$ . Since  $S$  is archimedean, there exist an element  $x$  in  $S$  and a positive integer  $m$  such that

$$a^m = xs.$$

Since  $A$  is  $R$ -pure in  $S$ , we have

$$a^m = sx \in A \cap Sx = Ax.$$

This implies that there exists an element  $b$  in  $A$  such that

$$sx = bx.$$

Since  $S$  is cancellative, we have

$$s = b \in A$$

and so we have

$$S \subseteq A.$$

Therefore we obtain that

$$S = A$$

and that  $S$  is  $R$ -pure-free. This completes the proof of the theorem.
