

101. On a Difference System of the Integrals of Pochhammer

By Toshihiro WATANABE

Department of Applied Mathematics, University of Gifu

(Communicated by Kôzaku YOSIDA, M. J. A., Nov. 12, 1980)

In this note we investigate a difference system of the integrals of Pochhammer

$$(1) \quad P_c(\hat{\lambda}) = \int_c (\zeta - a_1)^{\lambda_1} \cdots (\zeta - a_n)^{\lambda_n} d\zeta,$$

with respect to the variable $\hat{\lambda} = (\lambda_1, \dots, \lambda_n)$, for a suitable cycle \mathcal{C} . As is well-known, all the functions $P_c(\hat{\lambda} + \hat{k})$ ($\hat{k} \in \mathbf{Z}^n$) are expressed as linear combinations, with rational coefficients of $\hat{\lambda}$, in terms of $u_k(\hat{\lambda}) = P_c(\hat{\lambda} - \hat{e}_k)$ $k=1, \dots, n$, where \hat{e}_k is the unit vector $(0, \dots, \overset{k\text{-th}}{1}, \dots, 0)$ (cf. [3, § 18.26]). The difference system is determined by the following

$$(2) \quad u_i(\hat{\lambda} - \hat{e}_j) = (a_i - a_j)^{-1} (u_i(\hat{\lambda}) - u_j(\hat{\lambda})) \quad i \neq j,$$

with the fundamental relation

$$(3) \quad \sum_{i=1}^n \lambda_i u_i(\hat{\lambda}) = 0.$$

The system (2) and (3) defines an element of a cocycle belonging to the cohomology $H^1(\mathbf{Z}^n, GL_{n-1}(\mathbf{C}(\hat{\lambda})))$. But the structure of $H^1(\mathbf{Z}^n, GL_{n-1}(\mathbf{C}(\hat{\lambda})))$ for $n \geq 3$ seems generally very difficult to determine. Therefore, we consider the system of the following special type

$$(4) \quad u_i(\hat{\lambda} - \hat{e}_k) = \sum_{j=1}^n b_{ij}^k u_j(\hat{\lambda}) \quad i \neq k,$$

with the fundamental relation

$$(5) \quad \sum_{i,j=1}^n a_{ij} \lambda_i u_j(\hat{\lambda}) = 0,$$

where a_{ij} and b_{ij}^k ($k=1, \dots, n$) denote constant matrices of rank n and $n-1$, respectively.

Theorem 1 (A characterization of the Pochhammer system). *Suppose that the system (4) and (5) has $(n-1)$ linearly independent solutions which are meromorphic with respect to $\hat{\lambda}$. Then this system becomes (2) and (3), except for a constant multiple of each $u_i(\hat{\lambda})$ ($i=1, \dots, n$).*

From now on, we shall assume that a_1, \dots, a_n are real numbers such that $a_1 < \dots < a_n$. In the case of several variables, when we restrict ourselves to asymptotic expansions only in "rational directions", the solution of (2) is completely determined by a difference system of one variable ([1, Théorème 1.2]).

For nonzero vectors $\hat{k} \in \mathbb{Z}^n$, we have from (4) and (5),

$$(6) \quad u_i(\hat{\lambda} + \hat{k}) = \sum_{j=1}^n c_{ij}(\hat{k}; \hat{\lambda}) u_j(\hat{\lambda}),$$

where $c_{ij}(\hat{k}; \hat{\lambda}) \in \mathbb{C}(\hat{\lambda})$. By the method of R.D. Carmichael [2], we can obtain the asymptotic behavior of the solutions of (6).

Theorem 2. *For a generic direction (ω) defined by \hat{k} , the solutions $u_i(\hat{\lambda} + t\hat{k})$ of (6) have the following asymptotic expression as $\hat{\lambda} \rightarrow +\infty$,*

$$(7) \quad u_i(\hat{\lambda} + t\hat{k}) = \prod_{j=1}^n (\alpha - a_j)^{\lambda_j + t k_j} t^{r_i} (c_i + O(t^{-1})) \quad r_i, c_i \in \mathbb{C},$$

where the number α satisfies the equation

$$(8) \quad \sum_{i=1}^n k_i / (a_i - \alpha) = 0.$$

This is nothing else but the equation of the saddle points of the function $\text{Re} \log \prod_1^n (\zeta - a_i)^{t k_i}$.

In the case of $n=3$, we want to calculate the connection matrices between the different rational directions. For this, by the "saddle point" method, we look for two cycles $C_1(\omega)$ and $C_2(\omega)$ of steepest descent, or homologous to them, giving two corresponding independent solutions $P_{c_1(\omega)}(\hat{\lambda})$ and $P_{c_2(\omega)}(\hat{\lambda})$ of (2) and (3).

In order to avoid all ambiguity of (1), we choose a branch of (1) as follows:

(i) For each cycle C_i ($i=0, \dots, 3$) to be figured below, (1) is $\exp -\pi i \lambda_1$ $[-\infty, a_1]$ $[[a_1, a_2], \exp \pi i \lambda_2$ $[a_2, a_3], \exp i(\lambda_2 + \lambda_3)$ $[a_3, \infty]$), respectively.

(ii) For a closed cycle C , we take a branch of (1) such that the part of C below the real line is equal to some C_i ($i=0, \dots, 3$).

The coordinate $(P_{c_1}(\hat{\lambda}), P_{c_2}(\hat{\lambda}))$ is determined as follows:

(iii) For saddle points σ_i of C_i ($i=1, 2$), if σ_1 is a real number, $\sigma_1 < \sigma_2$. Otherwise, $\text{Im} \sigma_1 < \text{Im} \sigma_2$.

Remark. From (8), if $\text{Im} \sigma_1 \neq 0$, σ_2 is the complex conjugate number of σ_1 .

Under this situation, the connection matrix $E_{\omega\omega'}$ between two directions ω, ω' is defined by $(P_{c_1(\omega)}(\hat{\lambda}), P_{c_2(\omega)}(\hat{\lambda})) = E_{\omega\omega'} (P_{c_1(\omega')}(\hat{\lambda}), P_{c_2(\omega')}(\hat{\lambda}))$. We can calculate the connection matrices of (2) and (3).

Theorem 3. *In the case of $n=3$ and $a_1 < a_2 < a_3$, there are, in general, certain hypersurfaces in the (k_1, k_2, k_3) -space beyond which the given asymptotic expansion of Theorem 2 alters, and their hypersurfaces give the following twenty six subdomains. Also the table of the connection matrices between the first domain: $k_1 > 0, k_2 > 0, k_3 > 0$, and the others are given below.*

Table of the connection matrices

(I) $k_1 + k_2 + k_3 > 0$,

subdomain of Z^3		cycles	connection matrix	
$k_1 > 0, k_2 > 0, k_3 > 0$				
$k_1 > 0, k_2 < 0, k_3 < 0$			$\begin{pmatrix} 1 - \varepsilon_2, & 0 \\ 1 - \varepsilon_2 \varepsilon_3, & 1 - \varepsilon_3 \end{pmatrix}$	
$k_1 < 0, k_2 > 0, k_3 < 0$			$\begin{pmatrix} 1 - \varepsilon_1^{-1}, & 0 \\ 0, & 1 - \varepsilon_3 \end{pmatrix}$	
$k_1 < 0, k_2 < 0, k_3 > 0$			$\begin{pmatrix} 1 - \varepsilon_1^{-1}, & 1 - \varepsilon_1^{-1} \varepsilon_2^{-1} \\ 0, & 1 - \varepsilon_2^{-1} \end{pmatrix}$	
$k_1 < 0$ $k_2 > 0$ $k_3 > 0$	$k_1 + k_2 > 0$		$\begin{pmatrix} 1 - \varepsilon_1^{-1}, & 0 \\ 0, & 1 \end{pmatrix}$	
	$k_1 + k_2 < 0$		$\begin{pmatrix} 1 - \varepsilon_1^{-1}, & 1 - \varepsilon_1^{-1} \varepsilon_2^{-1} \\ 0, & 1 \end{pmatrix}$	
$k_1 > 0$ $k_2 > 0$ $k_3 < 0$	$k_2 + k_3 > 0$		$\begin{pmatrix} 1, & 0 \\ 0, & 1 - \varepsilon_3 \end{pmatrix}$	
	$k_2 + k_3 < 0$		$\begin{pmatrix} 1, & 0 \\ 1 - \varepsilon_2 \varepsilon_3, & 1 - \varepsilon_3 \end{pmatrix}$	
$k_1 > 0$ $k_2 < 0$ $k_3 > 0$	$D > 0$	$(a) > 0$		$\begin{pmatrix} 0, & 1 - \varepsilon_3 \\ 1, & 1 \end{pmatrix}$
		$(a) < 0, (b) > 0$		$\begin{pmatrix} 1 - \varepsilon_2, & 0 \\ 1, & 1 \end{pmatrix}$
		$(b) < 0, (c) > 0$		$\begin{pmatrix} 1, & 1 \\ 0, & 1 - \varepsilon_2^{-1} \end{pmatrix}$
		$(c) < 0$		$\begin{pmatrix} 1 - \varepsilon_1^{-1}, & 1 - \varepsilon_1^{-1} \varepsilon_2^{-1} \\ 1, & 1 \end{pmatrix}$
$D < 0$			$\begin{pmatrix} 1, & 1 \\ \varepsilon_1^{-1}, & \varepsilon_1^{-1} \varepsilon_2^{-1} \end{pmatrix}$	

(II) $k_1 + k_2 + k_3 < 0$

subdomain of Z^3		cycles	connection matrix	
$k_1 > 0, k_2 > 0, k_3 < 0$			L_1	
$k_1 > 0, k_2 < 0, k_3 > 0$			L_2	
$k_1 < 0, k_2 > 0, k_3 > 0$			L_3	
$k_1 < 0, k_2 < 0, k_3 < 0$			$\begin{pmatrix} 1 - \varepsilon_1 & 0 \\ 1 - \varepsilon_1 \varepsilon_2 & 1 - \varepsilon_2 \end{pmatrix} L_1$	
$k_1 > 0$ $k_2 < 0$ $k_3 < 0$	$k_1 + k_2 > 0$		$\begin{pmatrix} 1 & 0 \\ 0 & 1 - \varepsilon_2 \end{pmatrix} L_1$	
	$k_1 + k_2 < 0$		$\begin{pmatrix} 1 & 0 \\ 1 - \varepsilon_1 \varepsilon_2 & 1 - \varepsilon_2 \end{pmatrix} L_1$	
$k_1 < 0$ $k_2 < 0$ $k_3 > 0$	$k_2 + k_3 > 0$		$\begin{pmatrix} 1 - \varepsilon_2^{-1} & 0 \\ 0 & 1 \end{pmatrix} L_3$	
	$k_2 + k_3 < 0$		$\begin{pmatrix} 1 - \varepsilon_1 & 0 \\ 0 & 1 \end{pmatrix} L_2$	
$k_1 < 0$ $k_2 > 0$ $k_3 < 0$	$D > 0$	$(a) < 0$		$\begin{pmatrix} 1 - \varepsilon_3 & 0 \\ 1 & 1 \end{pmatrix} L_3$
		$(a) > 0, (b) < 0$		$\begin{pmatrix} 1 & 1 \\ 1 - \varepsilon_1 \varepsilon_2 & 1 \end{pmatrix} L_1$
		$(b) > 0, (c) < 0$		$\begin{pmatrix} 1 - \varepsilon_1 & 0 \\ 1 & 1 \end{pmatrix} L_1$
		$(c) > 0$		$\begin{pmatrix} 1 & 1 \\ 0 & 1 - \varepsilon_1^{-1} \end{pmatrix} L_1$
$D < 0$			$\begin{pmatrix} 1 & 1 \\ \varepsilon_1 \varepsilon_2 & \varepsilon_2 \end{pmatrix} L_1$	

In this table the symbols denote the following :

$$\varepsilon_j = \exp 2\pi i(\lambda_j + tk_j) j = 1, 2, 3.$$

$$L_1 = (1 - \varepsilon_1 \varepsilon_2 \varepsilon_3)^{-1} \begin{pmatrix} \varepsilon_2 \varepsilon_3 - 1, & \varepsilon_3 - 1 \\ 1 - \varepsilon_1 \varepsilon_2 \varepsilon_3, & 0 \end{pmatrix}.$$

$$L_2 = (1 - \varepsilon_1 \varepsilon_2 \varepsilon_3)^{-1} \begin{pmatrix} \varepsilon_2 \varepsilon_3 - 1, & \varepsilon_3 - 1 \\ \varepsilon_2 \varepsilon_3 (\varepsilon_1 - 1) & \varepsilon_3 (\varepsilon_1 \varepsilon_2 - 1) \end{pmatrix}.$$

$$L_3 = (1 - \varepsilon_1 \varepsilon_2 \varepsilon_3)^{-1} \begin{pmatrix} 0, & 1 - \varepsilon_1 \varepsilon_2 \varepsilon_3 \\ \varepsilon_2 \varepsilon_3 (\varepsilon_1 - 1), & \varepsilon_3 (\varepsilon_1 \varepsilon_2 - 1) \end{pmatrix}.$$

$$(a) = (k_1 + k_3)(a_2 - a_3) + (k_2 + k_3)(a_1 - a_3).$$

$$(b) = (k_1 + k_2)(a_3 - a_2) + (k_2 + k_3)(a_1 - a_2).$$

$$(c) = (k_1 + k_2)(a_3 - a_1) + (k_1 + k_3)(a_2 - a_1).$$

D is the discriminant of (8).

The arrow \rightarrow means the direction of the cycles. The five points on the real line \dashrightarrow denote $-\infty, a_1, a_2, a_3$ and $+\infty$ from the left to the right.

Remark (K. Aomoto). From (7) and (8), $H^1(Z^3, GL_2(\mathbb{C}(\lambda)))$ contains $(1, +\infty)$ as a set. Thus the situation is much different from the case of $H^1(Z^3, GL_1(\mathbb{C}(\lambda)))$ (cf. [4]).
