

## 42. On Hasse's Algorithm to Calculate Fundamental Units of Real Cyclic Biquadratic Fields<sup>\*)</sup>

By Ken-ichi YOSHINO

Department of Mathematics, Kanazawa Medical University  
(Communicated by Shokichi IYANAGA, M. J. A., June 7, 1994)

**1. Introduction.** Let  $K$  be a real cyclic biquadratic field with conductor  $F$  and  $k$  the quadratic subfield of  $K$  with conductor  $f$ . Let  $E_K$  and  $E_k$  be the groups of units of  $K$  and  $k$ , respectively. Hasse [1] defined the unit index of  $K$  as  $Q_K = [E_K : HE_k]$ , where  $H$  is the group of relative units of  $K$ , i.e.,  $H = \{\eta \in E_K; N_{K/k}(\eta) = \pm 1\}$ . Then  $Q_K = 1$  or  $2$ . Let  $E$  be the relative fundamental unit of  $K$ , i.e.,  $H$  is generated by  $\pm 1, E$  and the conjugate of  $E$  and let  $\varepsilon$  be the fundamental unit of  $k$ . For a number  $A$  of  $K$ ,  $A$  is uniquely written in the form  $A = \frac{1}{2} \left( u + \frac{v\tau(\chi) + v\overline{\tau(\chi)}}{2} \right) = [u, v]$ , where  $u, v$  are elements of  $k, \mathbf{Q}(\sqrt{-1})$ , respectively and  $\tau(\chi)$  is the Gauss sum of a generator  $\chi$  of the character group of  $K$  (cf. [1] §8). We call  $u$  and  $v$  the coordinates of  $A$ . If  $A$  is an integer of  $K$ , then  $u$  and  $v$  are integers of  $k$  and  $\mathbf{Q}(\sqrt{-1})$ , respectively. Let  $s$  be a generator of the Galois group of  $K$  over  $\mathbf{Q}$ . Let  $A' = A^s, A'' = A^{s^2}, A''' = A^{s^3}$  be the conjugates of  $A$ . Let  $a + bi$  be the basis number of  $K$  ("Basiszahl" von  $K$  in [1] p. 30).

If  $Q_K = 2$ , then there exists the unique positive unit  $E^*$  of  $K$  such that  $E_K = \langle -1, E^*, E^{*'}, E^{*''} \rangle$  and

$$(1) \quad E^* E^{*'} = \pm E, \quad N_{K/k}(E^*) = \pm \varepsilon.$$

$E^*$  is called the fundamental unit of  $K$ . By using (1) Hasse described a method of calculating the coordinates of  $E^*$  from  $\varepsilon$  and  $E$  ([1], §12 B). We put  $E = [(x_0 + x_1\sqrt{f})/2, y_0 + y_1i]$  and  $E^* = [(x_0^* + x_1^*\sqrt{f})/2, y_0^* + y_1^*i]$ . Hasse's method is summarized as follows: To get the non-equivalent solutions  $(x_0^*, x_1^*)$ , we examine the principal ideals  $(\alpha)$  of  $k$  such that  $N((\alpha)) = |x_0|$ . And, to get the non-equivalent solutions  $(y_0^*, y_1^*)$ , we examine the ideals  $\mathfrak{a}$  of  $k$  such that  $N(\mathfrak{a}) = |x_1|/G$  and  $\mathfrak{a} \in C_\varphi^{-1}$ , where  $G = F/f$  and  $C_\varphi$  is the ideal class of  $k$  which is corresponding to the primitive quadratic form  $\widehat{\varphi}(y^*) = b(y_0^{*2} - y_1^{*2})/2 + ay_0^*y_1^*$  with determinant  $f$ . We note that if  $Q_K = 2$  then  $G$  divides  $x_1$ . In this way we obtain a finite number of candidates  $(x_0^*, x_1^*, y_0^*, y_1^*)$  for  $E^*$ . Among them there are solutions of (1). However, if we use Hasse's method to calculate the coordinates of  $E^*$  from  $\varepsilon$  and  $E$ , then the calculation is complicated in general, because the number of candidates for  $E^*$  is large.

In this note we shall modify Hasse's method and give a simple algorithm. That is, our method is based upon the following fact:  $Q_K = 2$  if and only if

there exists a unit  $\gamma$  of  $K$  such that  $\gamma^2 = \rho \varepsilon E E'$ , where  $\rho = \text{sign}(E')$ . By our algorithm at most four candidates  $(x_0^*, x_1^*, y_0^*, y_1^*)$  for  $E^*$  are easily obtained for any real cyclic biquadratic field  $K$  and one of them exactly gives the coordinates of  $E^*$ . The aim of this note is to prove the following algorithm, wherein (2), ..., (6) denote the equations in §2.

**Algorithm.** (i) Calculate  $\rho \varepsilon E E' = [(t_0 + t_1 \sqrt{f})/2, r_0 + r_1 i]$  from  $\varepsilon$  and  $E = [(x_0 + x_1 \sqrt{f})/2, y_0 + y_1 i]$ .

(ii) Calculate at most two integer solutions  $(u_0, u_1)$  of (4) such that  $u_0 \geq 0$  for each integer solution  $X$  of (3).

(iii) For each  $(u_0, u_1)$  of (ii), calculate  $v_0, v_1$  by (5) and, when they are integers, examine whether or not  $(u_0, u_1, v_0, v_1)$  satisfies the former two equations of (2).

(iv) For an integer solution  $(u_0, u_1, v_0, v_1)$  of (2) such that  $u_0 \geq 0$ , put  $\theta = [(u_0 + u_1 \sqrt{f})/2, v_0 + v_1 i]$  and calculate the coordinates of  $\theta E''$ .

(v) By the values of cosine sums  $\Omega$  and  $\Omega'$ , calculate the approximate value of  $\theta E''$  and determine  $E^*$  by (6).

Using this algorithm, we shall also give a table of  $E$  and  $E^*$  for such a field  $K$  with conductor  $F < 300$ , wherein we correct some errors in Hasse's table.

**2. Proof of Algorithm.** From now on we consider a real cyclic biquadratic field  $K$  with  $Q_K = 2$  and suppose that  $E = [x, y] = [(x_0 + x_1 \sqrt{f})/2, y_0 + y_1 i]$  is given.  $\varepsilon$  is easily calculated by the well known algorithm. We put  $n(A) = N_{K/k}(A)$  for a number  $A$  of  $K$ . For the calculations of numbers of  $K$ , we need the following lemma which is shown in [1], §8. For  $u = (u_0 + u_1 \sqrt{f})/2$  and  $v = v_0 + v_1 i$ , we put  $\varphi(v) = a(v_0^2 - v_1^2) - 2bv_0v_1$ ,  $\widehat{\varphi}(v) = b(v_0^2 - v_1^2)/2 + av_0v_1$  and  $u \circ v = \{u_0(v_0 + v_1 i) + \sigma u_1(a - bi) \cdot (v_0 - v_1 i)\}/2$ , where  $\sigma$  is the sign defined by [1], §7 (12). Let  $N(u)$  and  $N(v)$  be the norms of  $u$  and  $v$ , respectively and  $G = F/f$ .

**Lemma 1.** For a number  $A = [u, v]$  of  $K$ , we have

$$(i) \quad A^2 = \left[ \frac{1}{2} \left( u^2 + G \frac{N(v)f + \varphi(v)\sigma\sqrt{f}}{2} \right), u \circ v \right],$$

$$(ii) \quad A^{1+s} = \left[ \frac{N(u) - G\widehat{\varphi}(v)\sigma\sqrt{f}}{2}, \frac{1+i}{2}(u' \circ v) \right],$$

$$(iii) \quad n(A) = A^{1+s^2} = \frac{1}{4} \left( u^2 - G \frac{N(v)f + \varphi(v)\sigma\sqrt{f}}{2} \right).$$

Using  $E = [(x_0 + x_1 \sqrt{f})/2, y_0 + y_1 i]$ , we first calculate the coordinates of  $\rho \varepsilon E E'$  by Lemma 1 (ii), where  $\rho = \text{sign}(E') = |E'|/E'$ . Put  $\rho \varepsilon E E' = [(t_0 + t_1 \sqrt{f})/2, r_0 + r_1 i]$ . Since  $Q_K = 2$ , there is an integer  $\gamma$  of  $K$  such that  $\gamma^2 = \rho \varepsilon E E'$ . In the following we calculate the coordinate  $[u, v]$  of this unit  $\gamma$ .

Since  $u = (u_0 + u_1 \sqrt{f})/2$  and  $v = v_0 + v_1 i$ , we obtain by Lemma 1 (i)

$$(2) \quad \begin{aligned} u_0^2 + u_1^2 f + 2G(v_0^2 + v_1^2) f &= 4t_0, \\ u_0 u_1 + \sigma G \{ a(v_0^2 - v_1^2) - 2bv_0v_1 \} &= 2t_1, \\ u_0 v_0 + \sigma u_1 (av_0 - bv_1) &= 2r_0, \\ u_0 v_1 - \sigma u_1 (av_1 + bv_0) &= 2r_1. \end{aligned}$$

We note that integers  $f, a, b, G, \sigma, t_j$  and  $r_j (j = 0, 1)$  are given. It is obvious that the number of the integer solutions  $(u_0, u_1, v_0, v_1)$  of (2) is exactly two, and that if we denote by  $(u_0, u_1, v_0, v_1)$  an integer solution of (2), the other one is given by  $(-u_0, -u_1, -v_0, -v_1)$ . Therefore we may find an integer solution  $(u_0, u_1, v_0, v_1)$  of (2) such that  $u_0 \geq 0$ .

Now, from  $\rho \varepsilon E E' = [u, v]^2$ , we have  $N(\varepsilon) E E'^2 E'' = N(\varepsilon) n(E) E'^2 = ([u, v]^{1+s})^2$ , so that  $\lambda \rho E' = [u, v]^{1+s}$ , where  $\lambda = \text{sign}([u, v]^{1+s})$ . So it follows from Lemma 1 (ii) that  $N(u) = \lambda \rho x_0$  and  $\sigma G \widehat{\varphi}(v) = \lambda \rho x_1$ . Noting that  $N(v)^2 f = \varphi(v)^2 + 4 \widehat{\varphi}(v)^2$ , we can eliminate  $v_0$  and  $v_1$  in the first two equations in (2). Namely we get

$$16t_0^2 - 8t_0(u_0^2 + u_1^2 f) + (u_0^2 + u_1^2 f)^2 = 4f(2t_1 - u_0 u_1)^2 + 16fx_1^2.$$

Since  $u_0^2 - u_1^2 f = 4\lambda \rho x_0$ , we have  $t_0(u_0^2 + u_1^2 f) - 2ft_1 u_0 u_1 = 2(t_0^2 + x_0^2 - ft_1^2 - fx_1^2)$ . Putting  $X = (u_0^2 + u_1^2 f)/2$  and  $Y = u_0 u_1$ , we obtain

$$\begin{cases} X^2 - fY^2 = 4x_0^2, \\ t_0 X - ft_1 Y = 4N(t) + 4N(x), \end{cases}$$

where  $N(t)$  and  $N(x)$  are the norms of  $t = (t_0 + t_1 \sqrt{f})/2$  and  $x = (x_0 + x_1 \sqrt{f})/2$ , respectively. Thus we have

$$N(t)X^2 - 2t_0(N(t) + N(x))X + 4(N(t) + N(x))^2 + ft_1^2 x_0^2 = 0.$$

We now give a lemma.

**Lemma 2.** *Under the above assumption and notation, we have*

$$N(t) + 2N(x) = -4N(\varepsilon) + x_0^2.$$

Therefore

$$(N(t) + N(x))^2 - N(t)x_0^2 = G^2 \widehat{\varphi}(y)^2 f.$$

*Proof.* By Lemma 1 (ii) we have  $4N(t) = N(\varepsilon)(N(x)^2 - G^2 \widehat{\varphi}(y)^2 f)$ . Since  $Q_K = 2$ ,  $N(\varepsilon) = n(E)$ . So Lemma 1 (iii) shows that  $GN(y)f = -8N(\varepsilon) + x_0^2 - 2N(x)$  and  $\sigma G \varphi(y) = x_0 x_1$ . Hence it follows from these equations that

$$\begin{aligned} 16N(t) + 32N(x) &= N(\varepsilon) \{4N(x)^2 + 32N(\varepsilon)N(x) + G^2 \varphi(y)^2 f - G^2 N(y)^2 f^2\} \\ &= N(\varepsilon) (-64 + 16N(\varepsilon)x_0^2), \end{aligned}$$

so that the first equation in Lemma 2 is obtained. The second equation is easily proved by the first one.

Now, by Lemma 2, the solutions of the above quadratic equation are given by

$$(3) \quad X = \{(N(t) + N(x))t_0 \pm F \widehat{\varphi}(y)t_1\} / N(t).$$

Since  $Q_K = 2$ , at least one of these solutions is an integer. Hence, to get  $u_0, u_1$  which satisfy (2), we may calculate them by the following system of equations for each integer solution  $X$  of (3), because  $u_0^2 - u_1^2 f = \pm 4x_0$ .

$$(4) \quad \begin{cases} u_0^2 = X \pm 2x_0, \\ u_1^2 f = X \mp 2x_0. \end{cases}$$

Here (4) formally means two systems of equations. However, since  $f$  is not a square of an integer, we may regard (4) as a system of equations. Therefore we obtain at most four integer solutions  $(u_0, u_1)$  of (4), because  $u_0 \geq 0$  and the number of integer solutions  $X$  is at most two.

On the other hand, the latter two equations in (2) give

$$(5) \quad \begin{aligned} (u_0^2 - u_1^2 f)v_0 &= 2r_0(u_0 - \sigma au_1) + 2\sigma br_1 u_1, \\ (u_0^2 - u_1^2 f)v_1 &= 2r_1(u_0 + \sigma au_1) + 2\sigma br_0 u_1. \end{aligned}$$

Hence, for each  $(u_0, u_1)$  which is an integer solution of (4), we examine whether or not  $v_0$  and  $v_1$  computed by (5) are both rational integers. If this is the case, we next examine whether or not  $(u_0, u_1, v_0, v_1)$  satisfies the former two equations in (2). In this way we obtain an integer solution of (2), since  $Q_K = 2$ . We denote it by  $(u_0, u_1, v_0, v_1)$  and put  $\theta = [(u_0 + u_1\sqrt{f})/2, v_0 + v_1i]$ . Then  $\theta$  and  $-\theta$  are exactly two solutions of  $\gamma^2 = \rho\epsilon EE'$ . Next we calculate the coordinates of  $\theta E'''$  by a formula in [1], p. 35 and calculate the approximate value of  $\theta E'''$  by cosine sums  $\Omega$  and  $\Omega'$  defined in [1], §8. Then we can obtain

$$(6) \quad E^* = \begin{cases} \theta E''' & \text{if } \theta E''' > 0, \\ -\theta E''' & \text{otherwise,} \end{cases}$$

because  $\theta E'''$  satisfies (1), i.e.,  $\theta E''' \theta' E = \pm E$  and  $\theta E''' \theta'' E' = \pm \epsilon$ .

Therefore we complete the proof of our algorithm.

**3. Table of  $E$  and  $E^*$ .** In the appendix of [1], Hasse tabulated the coordinates of  $E, E^*$ , the class number  $h$  of  $K$  and  $Q_K$  for a real cyclic biquadratic field  $K$  with conductor  $F < 100$ . There are some errors in his table. Using our algorithm, we give a table of the fundamental unit  $E^*$  for a real cyclic biquadratic field  $K$  with conductor  $F < 300$ , wherein the symbol “†” denotes the correction of the error in Hasse's table. As to the values of  $\Omega$  and  $\Omega'$ , we have  $\{|\Omega|, |\Omega'|\} = \{\alpha, \beta\}$  and  $4\Omega\Omega' = -2bG\sigma\sqrt{f}$  by [1], §8, where  $\alpha$  and  $\beta$  are given by

$$\alpha = \sqrt{G(f + |a|\sqrt{f})/2}, \quad \beta = \sqrt{G(f - |a|\sqrt{f})/2}.$$

So we can write the values of  $\Omega$  and  $\Omega'$  by  $\alpha$  and  $\beta$ . Our table consists of the following: 1. the conductor  $F$  of  $K$ , 2. the conductor  $f$  of  $k$ , 3. the basis number  $a + bi$  of  $K$ , 4. the fundamental unit  $\epsilon$  of  $k$ , 5. the values of  $\Omega$  and  $\Omega'$ , 6. the relative fundamental unit  $E$  of  $K$ , 7. the relative norm  $n(E)$  of  $E$ , 8. the sign  $\rho$  of  $E'$ , 9. the integer solution  $X$  of (3), 10. the coordinates of  $\theta$ , 11. the coordinates of  $E^*$ , 12. the relative norm  $n(E^*)$  of  $E^*$ , 13.  $E^*E^{*'}.$
