Jack Carl Kiefer
Collected Papers

I and II: Statistical Inference and Probability
III: Design of Experiments
Supplement: Additional Commentaries

Edited by **L. D. Brown, I. Olkin, J. Sacks,** and **H. P. Wynn**
(Copublished by Springer-Verlag and the Institute of Mathematical Statistics)

Together, these four volumes contain all of Kiefer's scientific papers—more than 100 papers comprising 1,600 pages. They cover a broad range of statistical subjects, including sequential and nonparametric analysis, decision theory, multivariate analysis, inventory theory, stochastic processes, and design of experiments. Annotated commentaries on certain papers trace their historical impact and explain their relationship to subsequent work.

Also included are three lectures presented at a memorial session held at the 1982 meeting of the IMS and ASA, Kiefer's bibliography, and a number of general papers and book reviews, several of them devoted to his hobby, the classification of mushrooms.

Volume I and II not sold separately.
1985, 502 and 590 pp., 40 illus. (Vol. I),
hardcover $100
ISBN 0-387-96003-1

Volume III
1985, 718 pp., 10 illus., hardcover $47
ISBN 0-387-96004-X

Supplement
1986, 56 pp., hardcover $22
ISBN 0-387-96383-9

IMS Member Prices:
Volume I and II: $75
Volume III: $35
Supplement: $16

INSTITUTE OF MATHEMATICAL STATISTICS

(Organized September 12, 1935)

The purpose of the Institute is to foster the development and dissemination of the theory and applications of statistics and probability.

OFFICERS AND EDITORS

The Latest Titles in Mathematical Statistics

An Introduction to the Theory of Point Processes

D. Daley and D. Vere-Jones

This book aims to bridge the gap between highly abstract theoretical treatments and informal treatments concerned with applications. It provides thorough coverage of recent work set in a broader historical perspective in an attempt to provide a wider audience with insights into recent theoretical developments. Many examples and exercises are presented throughout.

Contents: Early History • Basic Properties of the Poisson Process • Simple Results for Stationary Point Processes on the Line • Renewal Processes • Finite Point Processes • Introduction to the General Theory of Random Measures • Introduction to the General Theory of Point Processes • Cluster Processes, Infinitely Divisible Processes, and Doubly Stochastic Processes • Convergence Concepts and Limit Theorems • Stationary Point Processes and Random Measures • Spectral Theory • Palm Theory • Conditional Intensities and Likelihoods • Exterior Conditioning • Appendix: A Review of Some Basic Concepts of Topology • Measures on Metric Spaces • Conditional Expectations, Stopping Times, and Martingales.

1988. 702 pp., 1 illus. Hardcover $79.00
ISBN 0-387-96666-8

Goodness-of-Fit Statistics for Discrete Multivariate Data

T. Read and N. Cressie

The authors consolidate and extend the current fragmented literature on this subject by providing a unified analysis of a number of traditional goodness-of-fit tests and by introducing some new test statistics. As a by-product of their analysis, a new statistic emerges "between" Pearson's X^2 and the log-likelihood ratio G^2 that has valuable properties. This book is for applied statisticians, post-graduate students in statistics, and statistically sophisticated researchers and students in other disciplines.

Contents: Introduction to Power-Divergence Statistic • Defining and Testing Models: Concepts and Examples • Modeling Cross-Classified Categorical Data • Testing the Models: Large-Sample Results • Improving the Accuracy of Tests with Small Sample Size • Comparing the Sensitivity of the Test Statistics • Links with Other Test Statistics and Measures of Divergence • Future Directions • Historical Perspective: Pearson's X^2 and the Loglikelihood Ratio Statistic G^2 • Appendix • Bibliography • Author Index • Subject Index
1988. 211 pp., 7 illus. Hardcover $44.00

Parametric Statistical Models and Likelihood

O.E. Barndorff-Nielsen

Contents: Introduction. Likelihood and auxiliary statistics. Transformation models and exponential models. Reparametrizations and differential geometry. Inferential and geometric structures. Cumulants. Laplace's method. Edgeworth and saddle-point approximations. Distributions of likelihood quantities.
1988. 276 pp. Softcover $28.00
ISBN 0-387-96928-4
Lecture Notes in Statistics, Volume 50

Extremal Families and Systems of Sufficient Statistics

S. Lauritzen

Surveys the results in the area sometimes denoted as "partial exchangeability" or "deFinetti type theorems." Special sections are devoted to the study of sufficiency, of triviality of tails of Markov chains, studied for example by coupling methods, Martin boundaries and projective limits of Markov kernels and Polish spaces. In addition, many examples of extreme point models are treated in detail. Intended for researchers and graduate students in mathematical statistics and probability.
1988. 268 pp. Softcover $28.00

Lecture Notes in Statistics, Volume 49

Bayesian Spectrum Analysis and Parameter Estimation

G. L. Bretthorst

Contents: Introduction. Single Stationary Sinusoid Plus Noise. The General Model Equation Plus Noise. Estimating The Parameters. Model Selection. Spectral Estimation. Applications. Summary and Conclusions.
1988. 209 pp. Softcover $23.40
ISBN 0-387-96871-7
Lecture Notes in Statistics, Volume 48

{2} – Inverses and Their Statistical Applications

A.J. Getson and F.C. Hsuan

Much of the traditional approach to linear model analysis is bound up in complex matrix expressions revolving about the usual generalized inverse. The aim of this monograph is to present information that will allow the reader a better understanding, and possibly a simplification of the usual matrix expressions. While it is not exhaustive, this volume presents a comprehensive study of {2} – inverses in statistics. Chapter contents include: • time for {2} – inverses • {2} – inverses, quadratic forms and second degree polynomials • {2} – inverses and least squares solutions • {2} – inverses in linear models. This volume will be useful to anyone interested in linear model analysis.
