

4 **THE ADJOINT OF THE HIGHER ORDER HEAT OPERATORS ON JACOBI FORMS**

6 ANIMESH SARKAR

8
9 ABSTRACT. We compute the adjoint of higher order heat operators with respect to the Petersson scalar
10 product on the space of Jacobi cusp forms.11
12 **1. Introduction**13
14 Constructing new modular forms by means of derivatives of modular forms is well known in the theory of
15 modular forms. Recently, Kumar [15] constructed certain cusp forms by computing the adjoint of the
16 Ramanujan-Serre derivative of a cusp form with respect to the Petersson scalar product. The work of
17 Kumar [15] has been extended by Charan [2], where the author constructed cusp form by computing
18 the adjoint of the higher order Ramanujan-Serre derivative $\vartheta_k^{[r]}$. There is a natural generalization of the
19 differential operator ϑ_k in the case of Jacobi forms called the modified heat operator denoted by $\mathcal{L}_{k,m}$,
20 which is defined as

21
22
$$\mathcal{L}_{k,m} := L_m - \frac{m}{3} \left(k - \frac{1}{2} \right) E_2,$$

23
24 where $L_m := \frac{1}{(2\pi i)^2} \left(8\pi i m \frac{\partial}{\partial \tau} - \frac{\partial^2}{\partial z^2} \right)$, $\tau \in \mathcal{H}$, $z \in \mathbb{C}$. The operator $\mathcal{L}_{k,m}$ maps a Jacobi form φ of
25 weight k and index m to a Jacobi form of weight $k+2$ and index m , and is a linear map.26
27 The main aim of this paper is to construct Jacobi cusp forms using higher order heat operator. To do
28 this, we first define the higher order modified heat operator (defined in Section 3) and compute its adjoint
29 with respect to the Petersson scalar product on the space of Jacobi forms. To prove our result, we consider
30 certain generalized Jacobi Poincaré series. Such Poincaré series was first studied by Williams [19] in the
31 case of modular forms. Jha and Pandey studied similar Poincaré series for Jacobi forms in [10]. For more
32 details on the problems of construction of automorphics forms, we refer to [8, 9, 11, 12, 13, 14, 15, 18].33
34 We now give the outline of the paper. In the next section, we recall the basic definition and properties of
35 Jacobi forms. In Section 3, we state our main result (Theorem 3.1). In Section 4, we provide some results
36 which will be used to prove Theorem 3.1. A proof of Theorem 3.1 is presented in Section 5. Finally, we
37 give some applications of Theorem 3.1 in Section 6.38 **2. Preliminaries**39
40 Let \mathcal{H} and \mathbb{C} denote the complex upper half plane and the field of complex numbers, respectively. The
41 Jacobi group Γ^J is defined by

42
43
$$\Gamma^J := SL_2(\mathbb{Z}) \ltimes \mathbb{Z}^2 = \{ (M, (\lambda, \mu)) : M \in SL_2(\mathbb{Z}), \lambda, \mu \in \mathbb{Z} \}$$

44
45 *2020 Mathematics Subject Classification.* Primary: 11F50; Secondary: 11F60.*Key words and phrases.* Jacobi Forms, Heat operator, Poincaré series, Adjoint map.

with the group law $(M, X)(M', X') = (MM', XM' + X')$. The Jacobi group Γ^J acts on $\mathcal{H} \times \mathbb{C}$ via

$$\left(\begin{pmatrix} a & b \\ c & d \end{pmatrix}, (\lambda, \mu) \right) \cdot (\tau, z) := \left(\frac{a\tau + b}{c\tau + d}, \frac{z + \lambda\tau + \mu}{c\tau + d} \right).$$

Let k and m be fixed positive integers. For a complex-valued function φ defined on $\mathcal{H} \times \mathbb{C}$ and $\gamma = \left(\begin{pmatrix} a & b \\ c & d \end{pmatrix}, (\lambda, \mu) \right) \in \Gamma^J$, the slash operator of weight k and index m is defined as

$$(1) \quad (\varphi|_{k,m}\gamma)(\tau, z) := (c\tau + d)^{-k} e^{2\pi i m \left(-\frac{c(z + \lambda\tau + \mu)^2}{c\tau + d} + \lambda^2\tau + 2\lambda z \right)} \varphi(\gamma \cdot (\tau, z)), \quad (\tau, z) \in \mathcal{H} \times \mathbb{C}.$$

We define $\varphi|_{k,m}M := \varphi|_{k,m}(M, (0, 0))$ and $\varphi|_mX := \varphi|_{k,m}\left(\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}, X\right)$ for $M \in SL_2(\mathbb{Z})$ and $X \in \mathbb{Z}^2$. Then it is easy to check that

$$(2) \quad \varphi|_{k,m}(M, X) = (\varphi|_{k,m}M)|_mX.$$

Definition 2.1. A Jacobi form of weight k and index m for the Jacobi group Γ^J is a holomorphic function $\varphi : \mathcal{H} \times \mathbb{C} \rightarrow \mathbb{C}$ which satisfies $\varphi|_{k,m}\gamma = \varphi$ for all $\gamma \in \Gamma^J$, and has a Fourier series expression of the form

$$\varphi(\tau, z) = \sum_{\substack{n, r \in \mathbb{Z}, \\ 4mn \geq r^2}} c_\varphi(n, r) q^n \zeta^r, \quad (q = e^{2\pi i \tau}, \zeta = e^{2\pi i z}).$$

Furthermore φ is called Jacobi cusp form if $c_\varphi(n, r) = 0$ for $4nm - r^2 = 0$.

Let $J_{k,m}$ (resp. $J_{k,m}^{cusp}$) denote the vector space of all Jacobi forms (resp. Jacobi cusp forms) of weight k and index m . The space $J_{k,m}^{cusp}$ is a finite dimensional Hilbert space with respect to the Petersson scalar product defined as

$$\langle \varphi, \psi \rangle := \int_{\Gamma^J \backslash \mathcal{H} \times \mathbb{C}} \varphi(\tau, z) \overline{\psi(\tau, z)} v^k e^{-4\pi m y^2 / v} dV,$$

where $dV := v^{-3} dx dy du dv$, $(\tau = u + iv, z = x + iy)$ and φ, ψ are Jacobi cusp form of weight k and index m . For details on the theory of Jacobi forms we refer to [6].

2.1. Poincaré series. We now define the Jacobi Poincaré series of exponential type.

Definition 2.2. Let m, n and r be fixed integers with $r^2 < 4mn$. Then the (n, r) -th Poincaré series of weight k and index m is defined by

$$(3) \quad P_{k,m}^{n,r}(\tau, z) := \sum_{\gamma \in \Gamma_\infty^J \backslash \Gamma^J} e^{2\pi i(n\tau + rz)}|_{k,m}\gamma,$$

where $\Gamma_\infty^J := \left\{ \left(\begin{pmatrix} 1 & \lambda \\ 0 & 1 \end{pmatrix}, (0, \mu) \right) \mid \lambda, \mu \in \mathbb{Z} \right\}$ is the stabilizer of $q^n \zeta^r$ in Γ^J . It is well-known that $P_{k,m}^{n,r} \in J_{k,m}^{cusp}$ for $k > 2$ (see [7]).

The next lemma shows that the Petersson scalar product of a Jacobi cusp form $\varphi \in J_{k,m}^{cusp}$ and $P_{k,m}^{n,r}$ yields the (n, r) -th Fourier coefficient of φ up to some constant.

Lemma 2.3 (eqn. 1, p. 519, [7]). Let $\varphi \in J_{k,m}^{cusp}$. Then we have

$$(4) \quad \langle \varphi, P_{k,m}^{n,r} \rangle = \alpha_{k,m} (4mn - r^2)^{-k + \frac{3}{2}} c_\varphi(n, r),$$

where $c_\varphi(n, r)$ is the (n, r) -th Fourier coefficient of φ and $\alpha_{k,m} = \frac{m^{k-2} \Gamma(k - \frac{3}{2})}{2\pi^{k-\frac{3}{2}}}$.

For more details about the Poincaré series $P_{k,m}^{n,r}$ for Jacobi forms, we refer to [7].

Next we define the generalized Jacobi Poincaré series which will be used to prove Theorem 3.1.

1 **Definition 2.4** (Generalized Jacobi Poincaré series). Let $f(\tau, z)$ be a holomorphic function on $\mathcal{H} \times \mathbb{C}$
 2 with Fourier expansion

$$3 \quad f(\tau, z) = \sum_{\substack{n, r \in \mathbb{Z}, \\ 4nm > r^2}} a_f(n, r) q^n \zeta^r.$$

4
 5
 6 where the coefficients $a_f(n, r)$ satisfy the bound $a_f(n, r) = O((4nm - r^2)^{\frac{k}{2} - 6 - \epsilon})$. We define the generalized
 7 Poincaré series $\mathbb{P}_{k,m}(f)(\tau, z)$ associated to the seed function f as

$$8 \quad (5) \quad \mathbb{P}_{k,m}(f)(\tau, z) = \sum_{\gamma \in \Gamma_\infty^J \backslash \Gamma^J} f|_{k,m} \gamma.$$

9
 10
 11 *Remark 2.1.* The bound satisfied by the coefficient in the above definition is needed for the convergence
 12 of the series. More details can be found in [10].

13 **2.2. Higher order heat operator for Jacobi forms.** Recall that the classical heat operator is defined as

$$14 \quad L_m = \frac{1}{(2\pi i)^2} \left(8\pi i m \frac{\partial}{\partial \tau} - \frac{\partial^2}{\partial z^2} \right).$$

15
 16
 17 We now state a lemma without proof which gives the relation between higher order classical heat operator
 18 and slash operator defined in (1).

19
 20 **Lemma 2.5** (Lemma 3.1, p. 98, [3]). Let φ be a Jacobi form of weight k and index m . Then for a
 21 non-negative integer ν , $M = \begin{pmatrix} * & * \\ c & d \end{pmatrix} \in SL_2(\mathbb{Z})$, and $X \in \mathbb{Z}^2$, we have

$$22 \quad L_m^\nu(\varphi|_{k,m} M) = \sum_{l=0}^{\nu} (-1)^{\nu-l} \binom{\nu}{l} \left(\frac{2mc}{\pi i} \right)^{\nu-l} \frac{(k + \nu - \frac{3}{2})!}{(k + l - \frac{3}{2})!} \frac{L_m^l(\varphi)|_{k+2l,m} M}{(c\tau + d)^{\nu-l}}$$

23
 24
 25 and

$$26 \quad L_m^\nu(\varphi|_m X) = (L_m^\nu \varphi)|_m X.$$

27
 28
 29 An easy consequence of the above lemma is the following (take $\nu = 1$):

$$30 \quad (6) \quad (L_m \varphi)|_{k+2,m} M = L_m \varphi + \frac{m(2k-1)c}{\pi i(c\tau + d)} \varphi.$$

31
 32
 33 Therefore, in view of (2), $L_m \varphi$ is not a Jacobi form. However, we have the following:

34 **Proposition 2.6.** The modified heat operator $\mathcal{L}_{k,m}$ defined as

$$35 \quad (7) \quad \mathcal{L}_{k,m} := L_m - \frac{m}{3}(k-1/2)E_2,$$

36
 37 maps Jacobi forms (resp. Jacobi cusp forms) of weight k and index m to Jacobi forms (resp. Jacobi cusp
 38 forms) of weight $k+2$ and index m , where $E_2 = 1 - 24 \sum_{n \geq 1} \sigma(n) q^n$ ($\sigma(n) = \sum_{d|n} d$) is the Eisenstein series
 39 of weight 2.

40
 41
 42 *Proof.* The proof is just straightforward calculations, hence omitted. □

43
 44 *Remark 2.2.* From now on, we drop the index notation for $\mathcal{L}_{k,m}$ and write only \mathcal{L} ; as the index is fixed
 45 throughout the paper and the weight will be clear from the context.

3. Statement of results

For $n \geq 1$, we define the modified heat operator of order n , $\mathcal{L}^n : J_{k,m} \rightarrow J_{k+2n,m}$ recursively as follows:

$$(8) \quad \mathcal{L}^0 \varphi = \varphi, \quad \mathcal{L}^1 \varphi = L_m \varphi - \frac{m}{3}(k-1/2)E_2 \varphi,$$

and

$$(9) \quad \mathcal{L}^{n+1} \varphi = \mathcal{L}(\mathcal{L}^n \varphi) - \left(\frac{m}{3}\right)^2 n(k+n-3/2)E_4 \mathcal{L}^{n-1} \varphi.$$

By Proposition 2.6, $\mathcal{L}^n : J_{k,m}^{cusp} \rightarrow J_{k+2n,m}^{cusp}$ is a \mathbb{C} -linear map. Therefore, it has an adjoint map $\mathcal{L}^{n*} : J_{k+2n,m}^{cusp} \rightarrow J_{k,m}^{cusp}$ such that $\langle \mathcal{L}^{n*} \varphi, \psi \rangle = \langle \varphi, \mathcal{L}^n \psi \rangle$ for any $\varphi \in J_{k+2n,m}^{cusp}$ and $\psi \in J_{k,m}^{cusp}$. The aim of this paper is to compute the adjoint map of \mathcal{L}^n with respect to the Petersson scalar product. This is done by explicitly computing the Fourier coefficients of the image of φ under \mathcal{L}^{n*} for any $\varphi \in J_{k+2n,m}^{cusp}$. We now state the main result of this paper.

Theorem 3.1. *Let $k, m, n \in \mathbb{N}$ with $k \geq 4n + 4$. For any $\varphi \in J_{k+2n,m}^{cusp}$, the (N, R) -th Fourier coefficient of $\mathcal{L}^{n*} \varphi \in J_{k,m}^{cusp}$ is given by*

$$(10) \quad b(N, R) = \left(\frac{m}{\pi}\right)^{2n} \frac{\Gamma(k+2n-3/2)}{\Gamma(k-3/2)} (4Nm - R^2)^{k-3/2} \sum_{t \geq 0} \frac{a(t+N, R) \Omega_{k,m,n}^{N,R}(t)}{(4(t+N)m - R^2)^{k+2n-3/2}},$$

where $a(s, t)$ is the (s, t) -th Fourier coefficient of φ , the constants $\Omega_{k,m,n}^{N,R}(t)$ is given by

$$(11) \quad \Omega_{k,m,n}^{N,R}(t) = \begin{cases} \sum_{r=0}^n \binom{n}{r} \frac{(k+n-3/2)!}{(k+n-r-3/2)!} \left(-\frac{m}{3}\right)^r (4Nm - R^2)^{n-r} & \text{if } t = 0 \\ \sum_{r=1}^n \binom{n}{r} \frac{(k+n-3/2)!}{(k+n-r-3/2)!} \left(-\frac{m}{3}\right)^r (4Nm - R^2)^{n-r} e_r(t) & \text{if } t > 0, \end{cases}$$

$$\text{and } E_2(\tau)^r = \sum_{t \geq 0} e_r(t) q^t.$$

4. Preliminary results

We first state few results which will play a crucial role in the proof of Theorem 3.1.

Proposition 4.1. *Let n be a positive integer and φ a Jacobi form of weight k and index m . Then we have*

$$\mathcal{L}^n \varphi = \sum_{r=0}^n A_r^{n,k,m} E_2^r L_m^{n-r} \varphi,$$

$$\text{where } A_r^{n,k,m} = \binom{n}{r} \frac{(k+n-3/2)!}{(k+n-r-3/2)!} \left(-\frac{m}{3}\right)^r.$$

Proof. This can easily be verified by simple induction arguments and we omit the proof. \square

Next, we describe the image of Jacobi Poincaré series under \mathcal{L}^n in terms of the generalized Poincaré series.

Proposition 4.2. Let n be a positive integer and $k \geq 4n + 4$. Then we have

$$\mathcal{L}^n P_{k,m}^{N,R} = \mathbb{P}_{k+2n,m}(\varphi),$$

where the seed function φ is given by $\varphi(\tau, z) = q^N \zeta^R \sum_{r=0}^n A_r^{n,k,m} E_2^r (4Nm - R^2)^{n-r}$.

Proof. Since the proof is just a routine calculation, we give a brief sketch of the proof. For any $\varepsilon > 0$, we have $e_n(t) = O(t^{2n-1+\varepsilon})$, thus the convergence condition for $\mathbb{P}_{k+2n,m}(\varphi)$ becomes $\frac{k}{2} - 2n + \varepsilon > 2$. Thus, for $k \geq 4n + 4$, $\mathbb{P}_{k+2n,m}(\varphi)$ is given by

$$(12) \quad \sum_{\gamma \in \Gamma_\infty^J \backslash \Gamma^J} \varphi|_{k+2n,m} \gamma = \sum_{\gamma \in \Gamma_\infty^J \backslash \Gamma^J} \sum_{r=0}^n \frac{A_r^{n,k,m}}{(c\tau + d)^{2r}} E_2 \left(\frac{a\tau + b}{c\tau + d} \right)^r (L_m^{n-r}(q^N \zeta^R))|_{k+2n-2r,m} \gamma.$$

Since $E_2 \left(\frac{a\tau + b}{c\tau + d} \right)^r = \sum_{j=0}^r \binom{r}{j} (c\tau + d)^{r+j} \left(\frac{12c}{2\pi i} \right)^{r-j} E_2^j$, after a change of order of summation the right hand side of (12) is reduced to

$$\sum_{\gamma \in \Gamma_\infty^J \backslash \Gamma^J} \sum_{j=0}^n A_j^{n,k,m} E_2^j \left[\sum_{r=0}^{n-j} \binom{n-j}{r} \left(-\frac{2mc}{\pi i} \right)^{n-r-j} \frac{(k+n-j-3/2)! L_m^r(q^N \zeta^R)|_{k+2r,m} \gamma}{(k+r-3/2)! (c\tau + d)^{n-r-j}} \right].$$

Since the expression inside bracket is $L_m^{n-j}(q^N \zeta^R|_{k,m} \gamma)$, by linearity of L_m and slash operator, we can write the above expression as $\sum_{j=0}^n A_j^{n,k,m} E_2^j L_m^{n-j} \left(\sum_{\gamma \in \Gamma_\infty^J \backslash \Gamma^J} q^N \zeta^R|_{k,m} \gamma \right)$. Now the statement follows from

Proposition 4. □

5. Proof of Theorem 3.1

We write D and D_t for $(4Nm - R^2)$ and $(4(t+N)m - R^2)$ respectively. By Proposition 4.2, we have

$$\mathcal{L}^n P_{k,m}^{N,R} = \sum_{r=0}^n A_r^{n,k,m} D^{n-r} \mathbb{P}_{k+2n,m} \left(\sum_{t \geq 0} e_r(t) q^{t+N} \zeta^R \right) = \sum_{t \geq 0} \Omega_{k,m,n}^{N,R}(t) P_{k+2n,m}^{t+N,R},$$

where $\Omega_{k,m,n}^{N,R}(t)$ is given by (11). Using Lemma 2.3 and the definition of the adjoint map, we obtain

$$\alpha_{k,m} D^{-k+3/2} b(N, R) = \left\langle \mathcal{L}^{n*} \varphi, P_{k,m}^{N,R} \right\rangle = \left\langle \varphi, \sum_{t \geq 0} \Omega_{k,m,n}^{N,R}(t) P_{k+2n,m}^{t+N,R} \right\rangle = \alpha_{k+2n,m} \sum_{t=0}^{\infty} \Omega_{k,m,n}^{N,R}(t) \frac{a(t+N, R)}{D_t^{k+2n-3/2}}.$$

Upon simplification, the above equation yields

$$b(N, R) = \left(\frac{m}{\pi} \right)^{2n} \frac{\Gamma(k+2n-3/2)}{\Gamma(k-3/2)} (4Nm - R^2)^{k-3/2} \sum_{t=0}^{\infty} \frac{a(t+N, R) \Omega_{k,m,n}^{N,R}(t)}{(4(t+N)m - R^2)^{k+2n-3/2}}.$$

6. Applications

In this section, we apply Theorem 3.1 in some of the special cases and obtain special evaluation of certain L -series. Let E_4 and E_6 be the Eisenstein series of weight 4 and 6, respectively. We use the following

1 Fourier series expansion of E_4 :

$$2 \quad E_4(\tau) = 1 + 240 \sum_{n=1}^{\infty} \sigma_3(n)q^n = \sum_{n=0}^{\infty} \sigma_3(n)q^n, \text{ where } \sigma_3(0) := \frac{1}{240}.$$

3 **Example 1.** Consider $\varphi_{10,1} = \frac{1}{144}(E_6E_{4,1} - E_4E_{6,1}) \in J_{10,1}^{cusp}$, where $E_{k,1} \in J_{k,1}$ is the Eisenstein series
4
5 of weight k and index 1. By taking $\varphi = \varphi_{10,1}$ in Theorem 3.1, we have $\mathcal{L}^* \varphi_{10,1} \in J_{8,1}^{cusp} = \{0\}$, and
6 consequently
7

$$8 \quad 0 = \sum_{t=0}^{\infty} \frac{c_{10}(t+N, R) \Omega_{8,1,1}^{N,R}(t)}{(4(t+N) - R^2)^{8+2-3/2}},$$

9 where $c_{10}(N, R)$ is the (N, R) -th Fourier coefficient of $\varphi_{10,1}$. Computing the involved constants explicitly,
10 we have $\Omega_{8,1,1}^{N,R}(0) = (4N - R^2 - 5/2)$, and $\Omega_{8,1,1}^{N,R}(t) = -60\sigma(t)$ for $t > 0$. Therefore,
11

$$12 \quad 60 \sum_{t=1}^{\infty} \sigma(t) \frac{c_{10}(t+N, R)}{(4(t+N) - R^2)^{17/2}} = \frac{(4N - R^2 - 5/2)c_{10}(N, R)}{(4N - R^2)^{17/2}}.$$

13 Now, if we take $N = 1$ and $R = 1$, we obtain the following special evaluation of the above series.
14

$$15 \quad \sum_{t \geq 1} \sigma(t) \frac{c_{10}(4t+3)}{(4t+3)^{17/2}} = \frac{1}{3^{19/2} \times 2^2 \times 5}.$$

16 **Example 2.** Consider the Jacobi cusp form $\varphi_1 = E_4\varphi_{12,1}$ of weight 16 and index 1, where $\varphi_{12,1} =$
17 $\frac{1}{144}(E_4^2E_{4,1} - E_6E_{6,1}) \in J_{12,1}^{cusp}$. Then by taking $\varphi = \varphi_1$ in Theorem 3.1, we have $\mathcal{L}^{2*} \varphi_1 \in J_{12,1}^{cusp} = \mathbb{C}\varphi_{12,1}$,
18 and
19

$$20 \quad c_{\varphi_1} C_{12}(N, R) = \left(\frac{1}{\pi}\right)^4 \frac{\Gamma(16-3/2)}{\Gamma(12-3/2)} (4Nm - R^2)^{12-3/2} \sum_{t \geq 0} \frac{c(t+N, R) \Omega_{12,1,2}^{N,R}(t)}{(4(t+N) - R^2)^{16-3/2}}$$

21 for some $c_{\varphi_1} \in \mathbb{C}$, where $C_{12}(\alpha, \beta)$ and $c(\alpha, \beta)$ are the (α, β) -th Fourier coefficients of $\varphi_{12,1}$ and φ_1 ,
22 respectively. Since
23

$$24 \quad \varphi_1 = 240 \left(\sum_{t_1 \geq 0} \sigma_3(t_1)q^{t_1} \right) \left(\sum_{t_2, r \in \mathbb{Z}; 4t_2 - r^2 > 0} C_{12}(t_2, r)q^{t_2}\zeta^r \right),$$

25 we have

$$26 \quad c(t+N, R) = \sum_{t_1+t_2-N=t} \sigma_3(t_1)C_{12}(t_2, R).$$

27 Consequently, we have

$$28 \quad \delta_{\varphi_1} C_{12}(N, R) = \sum_{t \geq 0} \frac{\Omega_{12,1,2}^{N,R}(t) \sum_{t_1+t_2-N=t} \sigma_3(t_1)C_{12}(t_2, R)}{(4(t+N) - R^2)^{16-3/2}},$$

29 for some complex constant δ_{φ_1} . Again, by putting particular values of N and R , one can obtain various
30 arithmetic relations between the Fourier coefficients of $\varphi_{12,1}$ and E_4 .
31

32 **Acknowledgements.** The author is thankful to his supervisor Dr. Abhash Kumar Jha for suggesting
33 the problem and for his helpful comments and suggestions. The author also thanks University Grants
34 Commission (UGC), India for financial support.
